Well... given that Insignia's other SoftPC products range in price from
$200 to over $1000, and they ship 100's (thousands?) of these each day, I'm
not certain they would jump at the chance to make a 'whole' $5-$10 per copy
in the tiny and ever-shrinking Atari market. :)

As logical as such a move might seem to us, it's just not worth their
trouble and I'm sure they would view it as a potential expense, not profit.
Remember that Insignia is one of the 'big boys' with huge overhead. They
simply cannot operate on a shoestring budget like most Atari developers.

Maybe Ian will convince his buddy at Insignia to take Atari SoftPC out of
mothballs, finish it, market it and support it. Hey... it could happen. :)

I doubt they'd do any actual development work on it - it's already 2 years behind
their other versions so it's essentially unsupportable. I'll see what they say
though.

As far as i know,these 68k's are special manufactured 68k-processors,not the standard ones usually sold.But i would prefer a PAK/3 . Seeing a 68030 with 40 Mhz running is MUCH more fun than a poor 68k with only 28Mhz.
>Any answer is appreciated, especially from T28 or PAK-3 owners.
A friend of mine owns a PAK/3 and i've seen him working with it.He is going to use Linux soon...

s> programs on the Mac, but lacks GEM and AES. I would like full
s> emulation(!), and wonder if Geneva or some other program is the sort
s> of thing that I need, or is approaching it.

If Geneve and Mag!X are both _complete_ AES replacements then
you'll have a new problem : the VDI and/or the Line A calls !!!

I don't think Geneva and Mag!X replace the VDI at all ,after all
they really don't need to bother with it. This VDI problem however
can be solved by using NVDI .. . Also whether Mag!X and Geneva
take over _every_ single AES call is something I doubt about.

It should perhaps be possible to save the ROM from an normal ST
and then try to run it on MacMint but this might be illegal.

Does MacMint support auto-booting of disks ??? If yes ,try a TOS
boot disk ; a few PD libraries do have them .. .

300 quid??? Look past the Atari dealers, and you'll get the drive for
half that. Even when you add the cable and/or Link, you don't need to
pay anywhere near 300 pounds.

I have this modem, and it works well. You need to use 38K4 bps on your
serial port to make the most of it. But you can't use 38K4 with the
modem's default state:
It's an autosensing modem, ie you set the serial line speed on your
computer, and the modem tracks it without being explicitly set. You send
a dial command at 38K4, and the modem dials. It talks to another modem
and establishes an error-corrected 14400 link; it then decides that it
knows better, and switches its serial line to 19K2, so can't talk to
the computer. You need to disable the 'match serial speed to modem speed'
feature (something like AT &B1, can't remember exactly, but it's in the
manual). It will then talk at whatever speed it auto-senses from the
computer.

Eric's busy working on Jaguar stuff... he's still overseeing the MiNT
project, but most of the "real" work on MiNT is being done by hackers on
the MiNT mailing list. Eric is still the brains behind the MiNT source
archives that appear on atari.archive periodically...

Correct, you want some 100n de-coupling caps too and you may need to add
the missing resistor's - these are usually 68 ohm ones but check what
are already installed now on the existing RAS/CAS lines.

You're lucky, I'm grafting in 32 256*4 rams into a Mega ST-1 and I've
had to do some additional decoding for it (should've bought the Mega-2).

Cheers, Martin.

> I definitely appreciate being able to use both the keyboard and mouse.

As do I. I'm not flaming keyboard shortcuts (I wouldn't dream of using
an editor that required me to touch the mouse), I'm flaming those ugly
underlines that clutter dialogs and menus on PCs and workstations
running the evil Motif.

They're useless in most of the applications I've seen them in. For
example, the new GEM Lharc and ST-ZIP; I can either type "unzip foo.zip"
from my shell, or I can type "stzip foo.zip" and click, or use the
"accelarator" keys.

Now, if I ran st-zip by clicking on it or a .zip file, I'd have to _let_
_go_ of my mouse to start pressing those silly accelarator keys. The
underlines indicating them just serve to clutter the interface.

Accelarator keys should (IMHO) be reserved for menu selections, although
some people might find them convenient in dialogs; put them in your
dialogs, but don't underline them... the user who is going to complain
about moving from keyboard to mouse is going to be sophisticated (or
lazy) enough to remeber or know (if you picked good ones) them
intuitively.

From: bert@brazil.WPI.EDU
Message-ID: <BERT.94Jun28215903@brazil.WPI.EDU>
Source record: 31735

Hi,

we have two TT's and two SCSI HD, and we are wondering if it is at all possible, to hook them up on one SCSI bus together. Does any one have any experience with that?

Are there any other ways of making the comps share files, say, by using the networking ports?

Bert :)

Two dumbo questions I hope haven't been asked 123412 times...

What are some of the drivers/setups one should use with and without Mint on aa 1040stf. You mentioned Extendos...what's that?

If one has a standard SCSI cdrom hooked into the system with the appropriate drivers, does the cdrom drive read any cdroms? In other words, is there a standard format that say, all of Walnut Creek's Cdroms are encoded into?

Hasta,
Matt Koundakjian <mattk@netcom.com>

Thanks to me pestering ICD, (Yes HUTCH I know I am a Pest) they have now posted
there none Pro version of there Utils Version 6.5.5 on GEnie..

If you don't have a ICD host adapter in your system, you will be unable
to install the none Pro version..

So to cover that problem ICD now sell there Utils for people that don't
have a ICD host adapter, you also get CleanUp and the SCSI Util
Program with the Pro version, plus Support for CD Roms, Flopticals etc..

HUTCH, yes TOM did reply to me on GEnie, it must have been your help,
or Gods will....?

|>

There are dumb questions, but yours are not.

Most CD's are in a format called ISO-9660(?), older CDs for the PC are sometimes in a format called High Sierra(spelling?). There is also Kodaks Photo-CD formats (single and multi session) and a special format for Macintosh computers. All Atari drivers, that I am aware of, support both the ISO and HS formats. I believe that eXtenDos supports Photo-CD (single session), though your drive may not.

The CD-Rom you purchase should support the SCSI-II spec at least, and the SCSI-III spec if possible. Most drives only follow the SCSI-I spec, which was incomplete for CD-rom suuport and caused vendors to implement audio and Photo-CD support with proprietary commands, and that has caused all sorts of headaches with software vendors.

Something else to consider is the speed of the drive. CD-Roms are typcially referred to as single speed (150kB/sec), double speed (300kB/sec), triple speed (450kB/sec), and quad speed (600kB/sec). Double speed is pretty much the standard today. If you are considering NECs 3xi (triple speed) make sure you consider the Pioneer 604 (quad speed 6 disc changer) for only $300(US) more in Computer Shopper ($900 vs $1200).

The Walnut Creek CD's that I have are all in the ISO format. I have the GIFs Galore, Amiga AB20, Simtel-20, and MS-DOS Sources CDs from Walnut Creek.

Since you state that you are using a 1040STf I would recommend getting ExtenDos because I have had problems with MetaDos 2.0 and 2.2 locking up my system and sometimes not copying all of a file off of a CD-Rom, though I have not tried the latest version (2.3). ICDs MetaDos driver seemed to work fine but did not support the SCSI port of a TT, which I just happen to own. The only MiNT cdrom driver that I know works on an ST is the one I wrote but it requires you to use ICDs software and does not support Photo-CD. ICD may have an ST MiNT CD-Rom driver now but I

am unaware of it.

Because you are using an ST the overhead of the newer (1.04 and higher)
MiNT/Multi-TOS may be unaccaptable to you unless you have a CPU
accelerator. This will restrict you to either eXtenDos or Meta-Dos 2.3.

Brian

Does anyone out there know how to chech the Data-Carrier-Detect signal
on a Falcon RS-232. I also need to know how to set/clear the DTR-signal.

I have some docs on Falcon, but can figure out things (it was so easy on
ST and TT), so a source code on how to do this would be great !!!

^^^^^^
Is this the 60 quid Power Up jobbie? Can you recommend or (er) unrecommend it? I fancy a speed up, but the figures given in ST Review or somesuch suggested just 14% improvement, which I don't think I'd notice; according to benchmark programs my Falcon is faster than an ST, but it doesn't seem that way unless I run in mono mode.

I don't know if this is technically possible, but I reckon there could be a market for an `alternative (TT) RAM' board that takes standard SIMMs but not a faster processor; ie we can add 4MB, 8MB or whatever of TT Ram, which is accessed faster than ST Ram.

Finally, can anyone recommend OUTSIDE or any other vram products? 4MB is nowhere near enough, and I can't afford to buy 16MB yet (especially as it only increases my capacity by 10MB anyway). Specifically, is there any software *not* compatible with OUTSIDE? Can they run alongside it anyway, but just using physical ST Ram?

I have one of those, too - they're great. Mine does about 1450KB/s (Ratehd
with ICD ADSCSI). The LPS270 is very good, too, only you can't disable parity
checking with a jumper.
After all that I have heard from many users, quantum drives are very
reliable (opposed to Seagate).

If there is no internal host adapter installed, you have to put 8 (I think)
jumpers on the pins where it would be installed so that D0-D7 get connected to
the external port. It *should* be Pin 1-2, 3-4, ... until 15-16 on the
connector, but I am not sure about that.

Martin Vernon (martin@gw6hva.demon.co.uk) wrote:

MV>> Just remove the Rams and replace with 4*1 meg SIMMS, its that simple, that is
MV>> if you are into soldering and the such like....
MV>
MV>Ah no sorry. The point I was making was that I already have 4 megs of
MV>256*4 and hence want to add that - the 1*1 memories don't present a
MV>problem, I appreciate that.

It can be done - but I would not remommend that, since the power supply may be
a bit weak and it is a hell lot of work.
The easiest way would be to remove (or deactivate - CAS=RAS=Vcc) the 512K
and add another 2MB (you can solder those on the back of the old 2MB, only the
RAS/CAS lines per IC have to be connected by wire).

MV>However, what I need to do is demultiplex the A9 line and then gate it to
MV>create new CAS lines, which will be latched with RAS (per bank). I was
MV>just wondering if someone had already done it or had a schematic.

There are circuits that do exactly that - but they only add 1MB, so that you
can add 2MB and use the 1MB that were installed before. Here is the Listing
for such a GAL:

```
------------------------------------------------------------------------------
* 3 MB - Gal fï¿½r ATARI ST, (c) Jan Lipfert 92
*
* ________
* nc -| \/ |- VCC
* von MMU -> MAD9 -| |- nc
* -> RAS -| |- CASaL ->
* -> CASL -| |- CASaH ->
* -> CASH -| |- CASbL ->
* nc -| |- CASbH ->
* nc -| |- LTCH (nur intern benutzt)
* nc -| |- nc
* nc -| |- nc
* GND -| |- nc
* --------

%ID
3MB-Gal
%TYP
GAL16V8
```

```
%PINS
nc MAD9 RAS CASL CASH nc nc nc nc GND
nc nc nc LTCH CASbH CASbL CASaH CASaL nc VCC

%LOGIC

LTCH = MAD9 * RAS
+ MAD9 * LTCH
+ !RAS * LTCH;

!CASaL = !LTCH * !MAD9 * !RAS * !CASL;
!CASaH = !LTCH * !MAD9 * !RAS * !CASH;

!CASbL = LTCH * !MAD9 * !RAS * !CASL;
!CASbH = LTCH * !MAD9 * !RAS * !CASH;

%END
```

You can do the same in TTL, but in many cases (expecially when the 256K RAMs are 150ns), TTLs are too slow.

You would need two of these GALs (the second one would have !MAD9 replaces by MAD9).

MV>I realise that the original ST MMU's can't handle this directly but can
MV>the later STE's handle 2 chip SIMM's (being made up of 2 256*4 chips) up
MV>to the full 4Mb, if they can, then I'm looking for a schematic for that.

All ST MMUs handle DRAMS at leat up to 4MBit density. All ST MMUs can drive 2 RAM banks, not more. The GAL above tricks the MMU into thinking it is driving a 2MB bank, not a 512K bank.

CKC>is there? Would I be able to plug it into my other 1040STFM?

The main difference is that 2.06 runs in non-'E'-machines and 2.05 does not.
So you can't use it in an STFM.

CKC>If not how about getting the TOS switcher board that is used
CKC>for the upgrade to TOS2.06? Can I use that with my 2.05 roms?

That would be needed anyway since 2.06 is 256K instead of 192K at 1.0x - but
it won't help.

This is definitively not true. First of all, CDs don't have FATs. Second,
no CD-ROM can transparently handle multisession, as this would require
that the firmware knows about the ISO9660 format.

Anupam-

GDOS stands for Graphics Device Operating System. It's main purpose is to load fonts and device drivers, and make sure that output from programs which use GDOS gets to the right device. This reduces the program's memory requirements by allowing "modules" which any program can use for each device.

However, GDOS tends to slow down your system. So much that the slow up is easily visible. At boot up, GDOS displays a message that it is installed. The latest versions are 1.0 and 1.1 and display "GDOS RELEASE 1.x Installed." If you use Atari GDOS, I recommend one of these two versions; the earlier versions of GDOS generally had some problems.

The best replacement which I've seen, and which I use, is Codehead Software's G+Plus, which will automatically load different configuration files (for GDOS, called ASSIGN.SYS) when you run a program. It also won't slow your system down, and can even speed up some screen opperations.

Atari's latest version is called SpeedoGDOS, which also can change configuration at any time, has excellent support for vector (outline) fonts, and generally is considered by everyone to be and excellent product. If you have the memory (1Mb, I think), this is probably the way to go.

CodeHead's address was, last time I checked, P.O. Box 74090 Los Angeles, CA 90004, phone (213)386-5735. If this is wrong, someone please correct me!

Hope this helps!

Hi everyone!

I've been using Warp9 v3.75 since it came out, and have been very happy with the quality of the program and the increase in speed (I used QuickST before that!). Lately, though, I've been thinking about getting NVDI, since that's quite a bit faster. Before I go out and drop the money, though, I was hoping someone could answer some questions I've had about it.

1) How much faster (% increase) is NVDI than Warp9?
2) My system is a (U.S.) MegaSTE4 with external hard drive and TOS 2.06. Has anyone experienced any problems with this set up?
3) Compatibility issues. Does it work with the following programs (in order of importance):
DC DataDiet v2.1
Protect 6
Mouse-Ka-Mania II
Pagestream 2.2b
Storm v1.2
WordUp
WordWriter ST
STZip 2.6 (and ARC and LZH)
Graphics programs (PAD, Degas, Arabesque, CAD 3D2)

Anyone have any problems with it? Please let me know.

Thanks in advance!

A small clarification is in order here. ExtenDOS currently supports
single-session photoCD on the Toshiba 3401, and on those drives which
can automagically recognise XA mode (this is the recording method that
photoCD uses). Many recent drives do automatic recognition. Once the
automatic recognition is done, the rest is a relative breeze, since the
actual file-system structure for photoCD is ISO-9660. (Note that if
you actually want to look at those snaps, you need a program that
understands the photoCD image format).

3587. Wordup 3.0

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-29 23:31:40 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2ut08s$bik@mailer.fsu.edu>
Source record: 31660

Timothy Miller (millert@grad.csee.usf.edu) wrote:
> Why did WordUp 3.0 put Neocept out of business?
> Sure, it was kinda buggy, but it wasn't that bad!

Probably because they didn't sell enough of them (obvious answer). They were a small shop, and I have no doubt that piracy hurt them considerably. Perhaps WordUp's ease of use was to blame, as pirates had little incentive to purchase a product that was so easy to figure out how to use (wild guess). They were quite supportive of the product, and released numerous bug fixes (in fact, E. Arthur Brown Co. supported it for a short time after Neocept went under). The final version is fairly stable.

I heard that Atari purchased the rights to Wordup, and I held onto my copy just in case they every released it (hoping that I could upgrade my Neocept version to a newer Atari version). Unfortunately, it never seemed to happen. Perhaps some of the code was used in the word processing section of Atari Works (I have never seen it, so I don't know).

Wordup has the nicest dictionary and thesaurus setup of any English Atari word processor I have seen. In fact, I used it for awhile in the fast "text only" mode, which uses the standard system font and is not WYSIWYG. It is _much_ more stable in that mode than in WYSIWYG, and was excellent for composing text to be input into PageStream. Nowadays I use Microsoft Word for Mac via Spectre for word processing (I still use PageStream a lot though).

If in fact Atari does have the rights to Wordup, I wonder if they could release the source to the public domain (or as shareware, or for a reasonable fee, or something)? My guess is that Atari hackers would have the bugs fixed and features added in fairly short order. It would be very cool to have a top notch WYSIWYG word processor as PD/shareware. They would definitely have to charge something for the dictionary/thesaurus stuff (as it is licensed from another party, I believe), but the source to the program itself should be entirely in their control.

>experience with that?
>

Hi Bertram,

ICD claim in their docs which came along with the ICD-Pro SCSI driver
software that their drivers support SCSI bus arbitration, maybe you can try
installing those drivers and just connect the SCSI ports 1 on 1.

I have a SCSI cable connected from my TT to a PC with a no-name SCSI card
(which happens to have a D-25 external SCSI connector with the Macintosh =
TT pin layout) which can access the CD-ROM player and Tape streamer of the
TT with no problems. You might have to check bus termination though. I
removed all termination resistors from the TT mainboard, harddisk and
CD-ROM player, only the Tape streamer (which is on the end of the cable)
has termination.

The PC has also a set of termination resistors installed on the SCSI card.
Both run OK but simultaneous access locks up both computers. I think the
problem is that both machines have their ID's set as '7' (=master).

Another problem will arise because of both the Harddrives of your TT's will
be device '0' so one of you will have to set that to another number (ID
jumpers on drive) The result will be that you both will boot up from the
same HD with the other HD as 'extra space' Of course, with the cable
disconnected, the TT with the modified HD won't boot up anymore...

My 'SCSI' cable is a high quality printer cable (25pin-25pin) of about 3
meters length.

Well, good luck in trying.

Gert

While I agree that G+Plus is vastly better than the Atari GDOS, NVDI is
IMHO the best. In addition to accelerating GEM text and graphics, NVDI
also provides a built in GDOS. One can use GDOS fonts in place of the
system fonts with NVDI's GDOS as well. So, instead of putting money toward
G+Plus, I suggest you pay a bit more and get the best GDOS and the best
graphics acceleration you can get for the ST (IMHO). Actually, the cost of
G+Plus and Warp9 (strange, both Codehead products, and both almost but not
quite as nice as NVDI) together would approach NVDI's cost. Just my $0.02.

|> file, but there is no description of how
It will create it's own .hdf with a bit of fiddling. I can't remember exactly how
but I think when it boots and requests an .hdf, shovein a DOS disk in drive a:
and keep clicking on cancel on the fileselector. When this has been done a few
time, it will boot from the a drive. Once done, you can use the menu options to
persuade it to create a .hdf file. Of course, being non PD and commercial,
you wouldn't do this.

You can buy Atari schematics from their authorised dealers.
I got schematics for an STFM from:

L.D.S Ltd
Unit 22
Albany Park
Cabot Lane
Poole
Dorset
England
BH17 7BY

The phone number is: + 202 659991
Cost, about £34.

I guess they would be able to get whatever is published.
Atari drawings are not great quality though, but are better than nothing.

Good Luck

Yes, Atari bought the rights to WORDUP from Neocept. They
did, in fact, use part of WORDUP in ATARIWORKS's word
processor (sort of). And you'd be happy to hear that the
part they used was the dictionary/thesaurus AND that part
was written by Mike Fulton (formerly of Neocept, but NOW
a full-time Atari guy). It IS a nice dictionary/thesaurus!

I've had a bad experience with the 32Mhz upgrade. Maybe others had more luck.
Basically, I fitted it myself and got a dead Falcon. System solutions looked
at it and announced the board was dead ie it was faulty so I had no hope in
hell of doing a successful fitting, and then charged me 40GBP for putting the
replacement in! That doesn't work either and I've refused to pay carriage back
to them again so until I get around to taking it there by hand, it's stuck at
16Mhz...

|> Finally, can anyone recommend OUTSIDE or any other vram products? 4MB is
|> nowhere near enough, and I can't afford to buy 16MB yet (especially as it

3605. Probs with MSTE HD-Floppydisc-Access

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-30 13:07:41 UTC
From: bazd0011@rz03.FH-Karlsruhe.DE
Message-ID: <2uug2t$ede@nz12.rz.uni-karlsruhe.de>
Source record: 31682

Hello Hardware-Cracks,

I've got a serious problem with my MSTE4 while working with a high density floppy-disc-drive TEAC FD235HF 5xxx series i built in my MSTE 4 two weeks ago.

My MSTE4 was built in 01/91 and was at first equipped with:

- TOS 2.05
- WD 1772-02-02 FDC
- Epson DD Floppydisc-drive

After building in the HD-FDD working with the FDD in DD-mode was and even still is o.k. But while using it in HD-mode FORMATTING and WRITING to disc didn't work, WRITING worked, but very slowly (ca. 3min / 20KB).

I replaced the TOS 2.05 by TOS 2.06 and the WD 1772-02-02 with an AJAX but with no effect. Formatting and writing to disc are the same as above, only WRITING to disc works now, but also very slowly and with errors.

Reading in directories is possible, but very very slowly.
I've heard that early MSTE's have a hardware design fault, that makes it impossible to them to access HD FDD's correctly.
Maybe it leads to timing (handshake) problems and has something to do with the PAL U407 that provides the FDC with 8/16 MHz clock-signal.

Has anybody made the same or similar experience with MSTE's and HD-FDD's ?
Does anybody know, how to solve this problem ?
Maybe replacing this PAL with a new one, i.e. programming a new PAL ?
Could someone post me the JEDEC-File(s) ?

It would be very nice, if someone of you could help me with that problem.

Thank you very much in advance.
I hope hearing from you soon and apologise for my bad English.

Bye,

Zdenko

I do not know this magazine. But I know, that the developer informations about this topic (serial interfaces and their control lines) which atari distributes, were WRONG, FALSE, ... If the article should relay on this developer infromation only, it must contain false information too.

Why can I say this? I am the programmer of the HSMODA-packages of serial drivers. The included drivers allow "user programs" to access the serial ports in a UNIX/MiNT like style. The user programs are not in need of accessing the hardware directly. By the way, the actual version is HSMODA04.LZH. At the moment I do not know on which server it may lay, but I will try to upload it in the future.

At the moment I am sitting in front of a Indigo and not on my ST, so that I can not catch detailed information. Ok, I will use my head :-)

DTR and DCD of MODEM (I call it MODEM2) of the Falcon you can access in the same way as on MegaSTE and TT. Two importand things which Atari forgot (??? not mentioned, about the reasons everybody may think himselves) are:
You MUST disable the interrupts (CPU at IPL7) if you write a register number to the SCC and then like to read/write a register. Otherwise a interrupt may do its work and confuse the SCC.
You MUST use the RAM-shadow of the SCC-register WR5 if you like to write to WR5. Otherwise there may occur mystics. This shadow exists because WR5 is not not on every SCC readable. WR5 resides on Offset $1D in the IOREC of MODEM2. It is a byte. If you manipulate WR5, manipulate at first the RAM-shadow and then write the shadow into WR5.

(I dislike this XRN, I can not key in some importand special characters, sorry)

But I suggest the usage of my drivers. They run under TOS and MagiC (and MiNT too it think). I support TOS and MagiC, if anybody who is a good assembler programmer and a MiNT freak wants better MiNT support, he can take over this. Because MiNT/MultiTOS is to slow for me I do not use it.

Greetings, HS

I have a Mega Ste with TOS 2.05. How can I tell if I have eprom versions
of 2.06? Are 2.06 chips still being sold by ATari, or have they given up?
Is 2.05 really so bad?

Hello everybody !!

Someone has uploaded programs for me on Genie and Compuserve (both).
I know gates to have text email exchanges with him, these are
host@genie.geis.com and host@compuserve.com. But this doesn't allow
me to upload binary programs on these networks. Does anyone know how
to get linked to these (or one of these) networks, in order to exchange
large binary files. Thanks for help. Bye for now ...

Mega ST/STE computers both have detachable keyboards (a major plus right there, IMHO). For Mega ST verses standard STs, this is about the only difference (there is also an internal connect unique to the Mega STs, but it was not really used for much).

MegaSTE computers are a different story. There are several pros and cons:

Pros:
Can run the computer at 16mHz (clock doubled w/cache) right out of the box.
The keyboard, in addition to being detachable, is far superior to other Atari keyboards (TTs use the same unit).
Easy access to the guts of the machine, for SIMM additions, internal hard drive, or just curiosity. One screw removes a separate cover where much of the interesting stuff resides.
Has hardware support for Genlocking (never taken advantage of by anything, as far as I can tell, but one can hope).
Has three serial ports, two of which can go very fast (if they are not buggy, as some are).
Has a VME slot, which can use several graphics cards on the market (cards for TTs generally work in the MegaSTEs).
Most can use HD floppy drives, and some come with them.

Cons:
Runs TOS 2.05 or 2.06 only. Both of these tend to be less tolerant of older games than TOS 1.6x on the 1040STEs. On the other hand, 2.06 is in many ways nicer than 1.6x in terms of features. I use Neodesk, so it is a moot point for me.
Physically large case (same as TT). I kind of like it myself, but other complain :-). The design is unusual, again a matter of taste.
Difficult to use a Spectre GCR and have anything plugged into the MIDI ports at the same time. Irritating design flaw there.
HD floppy drives have even more problems with some older copy protection schemes (unconfirmed, as I have a 720K floppy in mine).

I _really_ like my MegaSTE, but I was careful to keep my Mega2ST as well, so all my old games can still be played (you can't beat that kind of multitasking :-). The 16mHz feature is great, and yields 1.5 to 1.9 times the speed of a regular 8mHz ST/STE. In general, I believe the MegaSTE is the best 68000 based machine Atari ever made (not surprising, as it was

the last one they made). If you do work on your computer(s), the 16mHz feature will be _greatly_ appreciated, as will the superior keyboard. If you do a lot of modeming with a high speed modem, the fast serial ports are a huge plus. If you are mostly a game person and have an extensive collection, perhaps the 1040STE would be a better choice due to its superior compatibility. I suggest you follow the age-old wisdom of the rec.guns moderator: buy'em all.

Oh, all MegaSTEs come with the ability to hook to a TV (I'm not sure if 1040STEs do). One thing that irritated me is that most of my null-modem games do not work on the MegaSTE, so even though I now have two STs I cannot play these games that way :-(. Falcon does not work, which was the one I was really looking forward to. Stunt Car Driver works with the null modem (on MegaSTE and Mega2ST), and is extremely cool. Also, virtually all of the games that do work on the MegaSTE also work at 16mHz, which is generally awesome (the machine boots into 8mHz mode by default for compatibility, but there are small booter programs that allow you to come up in 16mHz mode).

If you do get a MegaSTE, try to get a late model one, with HD floppy drive. I realize I list this as a con above, but my early model one (with 720K drive) has both buggy DMA sound (can be fixed by replacing the GST Shifter) and buggy extra serial ports (one can be fixed with a new GAL, the other by installing a better Zilog serial chip). I am happy with it, as I enjoy tinkering with these things, but had I known about this before I would probably have elected to buy a later model machine (the later model ones came with internal 50mb hard disks, and HD floppy drives) and perhaps fitted a 720k drive within (if in fact the HD floppies cause more compatibility problems).

From my experience, it is more compatible than Quick ST and Warp 9. Out
of the list you gave, I know from personal experience that it is OK with
PageStream 2.2b, STzip, Arc, Lharc. The only program I have that does not
get on with NVDI is the driver for the Tabby graphics tablet.

> internal SCSI host adapter interfaces with the motherboard), etc.

You can buy a copy of the Atari Field Technical manual for that machine
(or any of their others) and it will contain all this information. They
are neat, having lots of large fold-out schematics and valuable information.
I seem to remember that they are around $50 each. The MegaSTE one is worth it,
IMHO. It is an extensive document (a book, really).

I believe Best Electronics has them for sale. They are:

Best Electronics

Not sure this is true; Atari users some unbelievably reticent to spend money
on hardware. There are more powerful Ataris and clones now (Falcon, TT,
Medusa) but they're not selling in huge numbers.

Well, I'm not! They are a business, I am a business, so I don't pay more than
I need to. I accept that I may have to pay over the odds for Atari-specific
goodies, but not for standard stuff. I don't give money away to companies
just because they're good eggs.

And I'm less convinced that they are good eggs after this morning, when they
quoted week turnaround for warantee fix to my Falcon; I can't afford to be
without it for a week, I've got work to do!

>

I fitted the PowerUp2 accellerator in my Falcon myself (bought it from
system solutions for 50gbp at a show). Took about an hour to fit, worked
first time. No problems at all....but then, electronics is my job, so no
surprises there (if Sime's is reading this, then stop sniggering).

The speedup isn't to great though - shame the Baracuda040 board I saw at
the same show wasn't for sale. I really need a system with fast RAM that
isn't going to get stuffed by the Video Bandwidth (which is the real
crippler at the moment - st mono compile time 120sec, 800*600*16colour
compile time 220sec). The Baracuda had a seperate Video connector for a
kicking video board....

I don't know of anyway of telling if you have EPROMs without physically looking at them. All EPROMs have a little glass 'window' on the surface of the chip used for erasing (hince the 'E' in EPROM) the chip memory.

And to be perfectly honest, if you are not experiencing any problems with your current TOS 2.05 then upgrading to 2.06 would probably be a waste of time and money. I used TOS 2.05 in my early MegaSTe for 3 years with no problems. Just for jollies, I swapped my 2.05 ROMs with the 2.06 ROMs I had in a Gemulator and could detect no difference at all. Maybe I was just lucky, I don't know.

Bottom line is... "if it ain't broke, don't fix it." :)

CPU: 98% CPU: 96%
```

The key line to note is the VDI Graphics. NVDI is obviously the winner
there, and quite close to Warp9 in the other categories. If you do anything
that used GEM graphics (DTP would be a good example), NVDI is the clear choice.

> 2) My system is a (U.S.) MegaSTE4 with external hard drive and TOS 2.06.
> Has anyone experienced any problems with this set up?

That is what the figures above were generated on. I have no problems with
NVDI. It is great!

> 3) Compatibility issues. Does it work with the following programs (in
> order of importance):
> DC DataDiet v2.1
> Protect 6
> Mouse-Ka-Mania II
> Pagestream 2.2b
> Storm v1.2
> WordUp
> WordWriter ST
> STZip 2.6 (and ARC and LZH)
> Graphics programs (PAD, Degas, Arabesque, CAD 3D2)

I can vouch for PageStream, MKMII, Storm, Zip, and DEGAS Elite. In fact, I
think you might be hard pressed to find anything that does not work with
NVDI (I'm sure there are exceptions, but very very few).

> Anyone have any problems with it? Please let me know.

First, note that NVDI is not only a screen accelerator, but also a replacement
for GDOS. Thus, NVDI is roughly equivalent to Warp9 and G+Plus combined, which
brings the price difference down a bit. Also, NVDI is extremely robust.
I cannot attribute any errors or crashes to NVDI. In fact, after having used
NVDI for a couple of months (previously I used Warp9), my "weird crashes"
essentially went to zero and I felt confident enough to enable write caching
in the ICD hard drive software. Never before did I feel comfortable doing
so, as I would manage to crash or lock up my machine every two or three times
I used it. I went through the entire chain of accelerators (TurboST, QuickST,
Warp9, and NVDI), and NVDI is definitely the most compatible there is. My
advice would be to buy it immediately (actually, you might wait until the
recently announced v3.0 hits the shelves, but you get the idea).

G+Plus does have some features that NVDI's GDOS does not. However, the NVDI
GDOS is very fast. It is quite nice to have GDOS "around all the time"
(I used to only enable it when I needed it, to save boot time). One feature
of the NVDI is that one can use GDOS fonts in place of system fonts. This
works much better than my old method of using Neodesk's fontload.prg to replace
the system fonts.

Warp9 provides some neat extras, the main one being the screen saver modules.
I do miss these, but I make do with BeforeDawn (a shareware product) which
is almost as good. In some ways it is better, but the selection of savers
for it is limited. Both Warp9 and NVDI provide mouse acceleration, but
NVDI does not allow any fancy configuring of it (my version 2.11 does not,
at least), unlike Warp9. NVDI has few configurable options (about 5 or 6
buttons in the configuration acc), so I don't find myself playing with it
(as I did with Warp9, a lot :-). It is just there, and it just works.

I don't want to seem as though I am slamming the Codeheads. Warp9 and
G+Plus served me well for years, and I don't regret buying them. However,
I do feel that NVDI is superior to Warp9, and I have not found any reason to
go back to G+Plus either. I would really like to see the Codeheads release
the Warp9 screensaver as a separate application (Falcon compatible, as NVDI
seems to be very common on Falcon systems). I would buy it in a second!

The above is IMHO, direct flames elsewhere.

3621. Mac CPU <-> Atari monitor ???

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-30 22:22:47 UTC
From: toddc@loki.stanford.edu
Message-ID: <2uvgjn$csh@nntp2.Stanford.EDU>
Source record: 31596
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.mac.hardware,comp.sys.mac.misc

He describes the Atari connector as:

It is an SC1224 monitor, and the pins are as follows:
The plug is circular, with a notch in it. Holding the notch so it is
straight up(12 oclock), there are 3 rows of 4 pins, and a 13th pin centered
and directly below the three rows of four.(6 oclock)

The Mac side has a DB-25 25-pin connector.

Until next time...
Todd

```
i tried to use the setmatherr() function from math.h. this function is described as
followd:

void setmatherr(int (*errfunc)(struct exception *e));

i wrote a little test program ...

int myerr(struct exception *e)
{

/* do soemthing */

}

void main(void)
{
int a,b,c;
setmatherr(myerr);

a=b=0;
c=a/b; /* division by 0 ==>error! */
}

... when excecuting c=a/b the program jumps in myerr(), but *e contains nothing.
that means e is not allocated. what did i do wrong?
```

it didn't work, i got the following message:

rm: edi_vort.*: bad request

any other idea?

3624. diskette drive change question

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-01 07:46:38 UTC
From: hhakkine@cs.joensuu.fi
Message-ID: <1994Jul1.074638.3624@cs.joensuu.fi>
Source record: 31604

Hopefully this is the correct group !
I try to connect d/s drive Chinon FB-354 into an old ST.
The old broken drive was Sony MP-F11W-5DU s/s.
One book tells that Chinon F-354-C d/s has been used before,
and I hope this "new" one to work as well.

Now at least the comp understands that it has a diskette : before
the screen stayed white - sometimes ended up to show 4 or 6 bombs.
Now I get the icons to appear, but
1.) the drive keeps on rotating as long as the power is on
2.) I get a warning about "drive not ready" or "error during formatting"
etc depending on the command. And it seems not to read/write the disk.
All messages are in Swedish - but probably that doesn't matter else than
proving that it did not read my boot program.

Is there any helping angel there, who could tell, if I have to fix the
wiring in some way (I did nothing - just twisted the data cable around
to fit it in) ?

I'm booting with TOS 1.0 (5.29.85) from a ss-floppy.
Would I need a newer version for ds-diskettes ?
Or would I need ds-boot disk perhaps ?
I'm thankful for any hints.

Hannu.

Would these bugs be what causes my MSTE to occasionally fail to recognize the internal floppy when booting up? To be more explicit, once in a while I'll boot up and any attempt to access drive A returns a "drive does not exist" error, and within Selectric the drive selector menu doesn't display A or B. Restarting (warm or cold reboot) fixes the problem.

Right, in that case explain these facts:

* The CD-300 is multi-session, and is sold as such.
* Extendos does not have multi-session support in it yet. It does have
ISO and HS drivers though.
* I manage to use the above to work on multi-session Photo CD's I've had
developed.

Comments?

There are at least two text files on atari.archive.umich.edu that might
help. One is genflop.lzh, the other ibmfloppy.lzh. They both contain
instructions for hooking floppy drives to the ST. They should both
be in the Disk section. Hope that helps.

Here is the ony and only existing history from ATARI:

Towns' Little Guide to TOS Revisions, version 1.0

Written by John Townsend, Atari Corporation

This is a small document that explains in very terse terms the
differences between the TOS revisions available for ST/MEGA/STE/
Mega STE/TT machines, what patches are needed for what revisions, the
formats they are available in, and any notes I can think of.

I hope this will clear up some of the confusion with the different
TOS versions. If you have any questions on this document, please
let me know here on GEnie. My GEnie Address is: TOWNS.

Special thanks to Leonard Tramiel, Allan Pratt, and Doug Wheeler
for their involement with this little Document. Thanks again!

Comments are welcome..

-- John Townsend
Atari Corp.

==========

ROM TOS (TOS 1.0)

The original ROM TOS, this version shipped in 520ST and 1040ST
machines. It is no longer shipping in any machines.

Formats: 2 chip ROMs, 6 chip ROMs

Machines: 520ST, 1040ST

Utilities: FOLDRXXX.PRG

FOLDRXXX.PRG will add more entries into your OS Pool.
In TOS 1.0 and TOS 1.02, the limit for the number of
directories that you can enter is around 40. With this
program you can extend that limit much higher. If you
are using a hard drive, this program is recommended
highly. It will work with all TOS versions and will
improve the performance of your system.

Notes: GET TOS 1.04 TODAY! TOS 1.04 is the latest version of TOS
for 520/1040/MEGA owners. It is MUCH faster, has faster,
better disk I/O, many other improvements.

MEGA TOS (TOS 1.02)

This is commonly referred to as MEGA TOS. This version of TOS fixes
some minor problems in TOS 1.0 and has support for the BLiTTER chip
and Real-Time Clock chip.

Formats: 2 chip ROMs, 6 chip ROMs

Machines: 520ST, 1040ST, Mega 2, Mega 4

Utilities: FOLDRXXX.PRG

FOLDRXXX.PRG is explained above.

Notes: See notes for TOS 1.0.. GET TOS 1.04 TODAY!

Rainbow TOS (TOS 1.04)

TOS 1.04 or Rainbow TOS, as it is commonly known is the latest
version of TOS available for 520/1040/MEGA owners. It has been
available as a dealer upgrade for awhile now. It has much more
robust Disk I/O, Autorunning of GEM programs at boot up,
a fix for the 40 folder limit, and much more. Most of all is
it much faster than previous versions of the Operating System.

Formats: 2 chip ROMs, 6 chip ROMs (available as Upgrade!)

Machines: Stacy

Utilities: TOS14FIX.PRG, POOLFIX3.PRG, CACHEXXX.PRG, FOLDRXXX.PRG

TOS14FIX.PRG solves some small problems in the AES (for
additional information, please see the documentation that
accompanies the TOS14FIX.PRG program).

POOLFIX3.PRG fixes a bug in GEMDOS. Documentation that
accompanies the POOLFIX3.PRG program explains (in detail)
the problem that it fixes.

CACHEXXX.PRG is a new program that adds GEMDOS buffers
to your system. The caching of data and disk directories
by GEMDOS (when this program is used) will result in
your system running much faster! This program is highly
recommended and requires TOS 1.04 or higher for full
benefits!

FOLDRXXX.PRG is explained above.

Notes: Please use the utilities available and if you haven't
upgraded to this version of TOS yet.. please consider
doing so. It's a very worthwhile upgrade.

There are some disk-based versions of _early_ developer
only releases of TOS 1.04 floating around on BBS systems
here in the United States and abroad. Please don't use
them! They are bad news! They have some very nasty bugs
and have been known to corrupt data!

STE TOS, Rev 1 (TOS 1.06)

TOS 1.06 is the TOS version that is shipped with the 1040STE and
520STE machines. It is essentially TOS 1.04 with support for the new
hardware that the STE has.

Formats: 2 chip ROMs

Machines: 520STE, 1040STE

Utilities: STE_FIX.PRG, POOLFIX3.PRG, CACHEXXX.PRG, FOLDRXXX.PRG

STE_FIX fixes the infamous Desktop Medium/Low resolution
bug. The problem is that there is a bug in the desktop
code in this version of TOS that prevents the user from
booting into Medium Resolution. The patch program STE_FIX
will solve the problem. Once it is executed in the AUTO
folder, the problem no longer exists.

FOLDRXXX.PRG, CACHEXXX.PRG, and POOLFIX3.PRG are
explained above.

Notes: This version is only available in 1040STE and 520STE
machines. It isn't available for upgrading. It won't
work in older machines.

STE TOS, Rev 2 (TOS 1.62)

This is a slightly revised revision of TOS 1.6. It fixes the POOLFIX
problem in GEMDOS and the problem in the Desktop that was present in
TOS 1.06.

Formats: 2 chip ROMs

Machines: 520STE, 1040STE

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only available in 1040ST and 520STE
machines. It isn't available for upgrading.

Mega STE TOS (TOS 2.05)

TOS 2.05 is the version of TOS currently shipping in the Mega STE.

Formats: 2 chip ROMs

Machines: Mega STE

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only available in the Mega STE. It isn't
available for upgrading.

TT TOS (TOS 3.01)

TOS 3.01 is the version of TOS that originally shipped in the TT030.

Formats: 4 chip ROMs

Machines: TT030

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only avaible in the TT030. It isn't
available for upgrading.

TT TOS (TOS 3.05)

TOS 3.05 is the latest version of TOS currently shipping in the
TT030.

Formats: 4 chip ROMs

Machines: TT030

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG, SERPTCH1.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only avaible in the TT030. It isn't
available for upgrading.

3636. UUCP Problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-02 01:25:54 UTC
From: Steve.Barnes@lchurch.mcd.on.ca
Message-ID: <773134888.0@lchurch.mcd.on>
Source record: 31566

G'day all!

I'm having a problem with UUCICO72 here, and hoping somebody out their is running the same. Here goes.

How do you get it to use e-proto as a default OR use increased g-proto packet sizes? This has got me really confused. I call UUCICO72 directly to place a call, all documented environment variables are set etc.. with the following command line:

uucico72 -smindy -pe -r20 -f

It dials out just fine, connects (usually.. crappy phone line :), negotiates and logs in. However my end *SHOWS* its using e-proto as a default (I've included the lowercase 'e' at the end of the phone number in my hosts file).. My hosts logs show a NO negotiation for e-proto, and using g-proto with 64 byte packets. This KILLS throughput with the modem just thrashing itself to pieces.

I've even tried g-proto with 512 byte packets. Nothing happens, UUCICO just sits their stating its gone into slave mode and does nothing. I'm really at a loss after 2 months of messing about with it. Please, HELP! :)

A thousand thanks in advance!

You know what I can never stand about any OS I've encountered... when the encounter a bad sector, they just STOP! They just say that you have a problem, and keep saying or over and over again. Why don't they just mark the sector as bad and write to another one? Wouldn't that make sense? At least you'd be able to write to the disk. When the file is partially written, you can't just pop in another disk... the OS is expecting the same FAT and partially written file.

: But where can a get a copy of that over here in Norway ?

Talk to an Atari dealer and have him order some. Talk to a distributor and ask for it. Selling to Europe won't be cost effective enough without sufficient demand, but if you can get a distributor asking for some, we'll sell them.

You could also order a single copy from us, but the exchangin of funds won't be very easy, especially for something as low as $3.50US plus shipping.

: In article <2usn08$6mf@mother.usf.edu>, millert@grad.csee.usf.edu (Timothy Miller) writes:
: >
: > Processor Direct magazine, issue #2 will detail this.

: I do not know this magazine. But I know, that the developer informations about this topic (serial interfaces and their control lines) which atari distributes, were WRONG, FALSE, ... If the article should relay on this developer infromation only, it must contain false information too.

Actually, I developed the routines myself. I got a book on the SCC, got the timing signal values and went from there. It works great.

: Why can I say this? I am the programmer of the HSMODA-packages of serial drivers. The included drivers allow "user programs" to access the serial ports in a UNIX/MiNT like style. The user programs are not in need of accessing the hardware directly. By the way, the actual version is HSMODA04.LZH. At the moment I do not know on which server it may lay, but I will try to upload it in the future.

: At the moment I am sitting in front of a Indigo and not on my ST, so that I can not catch detailed information. Ok, I will use my head :-)

The user programs don't have to access the hardware? Are there OS routines to access DCD, DTR, and set higher baud rates? I am not aware of these. I wrote my own, and I can get a plethora of baud rates higher than 19200.

: DTR and DCD of MODEM (I call it MODEM2) of the Falcon you can access in the same way as on MegaSTE and TT. Two importand things which Atari forgot (??? not mentioned, about the reasons everybody may think himselves) are:
: You MUST disable the interrupts (CPU at IPL7) if you write a register number to the SCC and then like to read/write a register. Otherwise a interrupt may do its work and confuse the SCC.

I didn't disable any interrupts. The only thing that I know of that will confuse the SCC is to write to it too fast. You have to wait 4 PCLK's after every byte you write to it.... or is that every command... I don't know but I made my routines inefficient for that.

For doing some things, I completely reset the SCC, which is like a 20 step process. I've never had any problems. One friend had a problem with 57600 (I don't think it was the 0.4% error in data rate), but had no problems with 38400.

: You MUST use the RAM-shadow of the SCC-register WR5 if you like to write to WR5. Otherwise there may occur mystics. This shadow exists because WR5 is not not on every SCC readable. WR5 resides on Offset $1D in the IOREC of MODEM2. It is a byte. If you manipulate

WR5, manipulate at first the RAM-shadow and then write the shadow into WR5.

Well, this is useful information. If you don't mind, I may add it to my article. How do I get at the Iorec of modem2? Which device is it? And which number do I give Iorec()?

: (I dislike this XRN, I can not key in some importand special characters, sorry)

: But I suggest the usage of my drivers. They run under TOS and MagiC (and MiNT too it think). I support TOS and MagiC, if anybody who is a good assembler programmer and a MiNT freak wants better MiNT support, he can take over this. Because MiNT/MultiTOS is to slow for me I do not use it.

How do you use your drivers? Do they handle DTR, DCD, and set baud rates higher than 19200? Do you have support as many standard rates over 19200 that you could figure out how to do? I got quite a number of them... like 13 or so, within 0.7% error.

Any information you can give me will be appreciated, and I'll mention you in my article. Hopefully, some of what I have done will help you when you get to read my article.

: Greetings, HS

Hi,

I am hoping that someone can help me with this problem; I want to add items to an existing object tree. For example, I load the resource file into memory using rsrc_load() and then decide that I want to add twenty icons to the first tree. The objc_add() call is none too specific about how this is done. Could someone explain the process to me in detail? I would really appreciate it.

Hi, Im a sysop of an atari bbs and also a cdrom owner, my software (Total Logic Control 1.5) doesn't directly support CD-roms, although I do have the drive set up through extendos, what I'm wondering is this...

Is there a CDROM DOOR (like on many ibm bbs's) for the Atari? Something that would get its stats from say Dorinfo1.def or Forem.Dat... I'd love to hear from anyone working on, or interested in developing such a door, I have a mega ST, an STe and am a registered owner of TripLinK and Total Logic bbs packages available for testing...

anyone know anything? :)

Andy

3646. Atari Falcon SCSI connections

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-02 18:07:12 UTC
From: michaelk@pacifier.rain.com
Message-ID: <CsBro1.xM@pacifier.rain.com>
Source record: 31626
Cross-posted to: comp.music,comp.sys.atari.st,comp.sys.atari.st.tech,rec.music.makers

My SCSI set-up is 4 meg Atari Falcon w/ 80 meg IDE, SCSI II port connected to an external 240mg HD . I recently bought a SyQuest Cartridge HD --- intenting to connect The SyQ to my external HD and then connect my SCSI sampler to the SyQ. My sampler is a Peavey SXII/SP combination which have 25 pin SCSI connections. My terminations need to include the Peavey SXII (permanently terminated) -- and going on the assumption that the Falcon is an end terminator, I set my SCSI ID according to the Falcon manual: external HD=0, SyQ=1 (skip 2)& sampler = 3. When I try to run the system I get id 0 to respond but id 1 produces the message "id 1 not responding" but id 3 will respond if I reverse the id's between the external HD and the SyQ, but still whatever I assign to id 2 I get no response. When I tried a straight sequence of id numbers (not skipping after the last hard drive) everything reads except whatever id 0 is! Also I estimate I have about 11 feet of SCSI cabling but people locally have told me that shouldn't make a difference. I have gotten these combinations to work : Falcon + 240mg HD + SyQ or SyQ + Peavey SP + Peavey SX but never the Falcon and Peavey together.

Questions:

**I've been told the Falcon and Peavey should work together --- can anyone confirm this ?

**I read an article recently which indicated that cable thickness could be a factor, the thicker ones providing less problems -- if this is so how does one tell which type one has ?

**I've read that SCSI II uses "active" termination while SCSI I uses passive termination and that there could be compatability problems. If this turns out to be my problem (assuming the SXII is passive) does any one know of a compatability fix ?

**Could there be problems simpling connecting a DB50 to a DB25 device?

Any comments are very much appreciated.....

michaelk

: whatever I'm doing wrong, it's a doozy. AHDI 5.0 and its associated
: utilities can't even *find* the drive, let alone format it.

: Anybody have any ideas?

As someone who just went through a similar problem for a month, I
think I can help a little.
Does AHDI tell you that it's NOT BOOTLOADED when it runs? If so,
check the connections. Make sure that the SCSI cable is FIRMLY in both
slots and not backwards. Also, I found out that Atari systems do not use
parity so you shouldn't have parity enabled (At least, this is what B&C
told me). Also make sure that you set it to the right SCSI address (Unit
0 I believe). You can do this with the jumpers. If possible check your
manual to see which jumper does what and how you should set the jumpers.

Good Luck!

3649. Ensuring ALL caches are written

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-02 23:46:46 UTC
From: sourada@iastate.edu
Message-ID: <sourada.773192806@las1.iastate.edu>
Source record: 31629

I'd like to be able to have my system reboot automatically after reconfiguring, while ensuring that ALL caches have been written back to the hard drive. I'm using ICD's utils and Minixfs. I've tried all kind of things to try to ensure that everything is written, but they don't seem to work.

For example, I wrote a program called sync that just calls sync() from the mint libraries (it's supposed to sync all minixfs partitions). Then I tried the following at the tcsh prompt:

```
cp a.out b.out; sync; flush
```

(flush.prg is ICD's write cache flusher)

After this executed and ICD program reported that the caches were flushed, I still got some disk activity a little while later.

Is there a reliable way to make sure all the caches are flushed, rather than turning all the caches off or waiting a long time before rebooting?

Thanks,
Steven

The spec says 7 feet, and unless you are using really good cable, 11 is
stretching your luck. Try less cabling to start with...

Also, what ID do you have the SP set to? it sounds awfully like it may
be on 3.

>**I've been told the Falcon and Peavey should work together --- can
>anyone confirm this ?

Yup. Done it. (Never had any software to test it with, waiting for
Notator Audio.)

>**I read an article recently which indicated that cable thickness
>could be a factor, the thicker ones providing less problems -- if
>this is so how does one tell which type one has ?

sigh Thickness has nothing to do with it, the impedance match does -
but how many magazine writers would be able to write about impedance
matching? *big*grumble*

As a rule, stay under 7 feet and all will be well. If you _have_ to
go over that, use cable specifically made for SCSI.

>**I've read that SCSI II uses "active" termination while SCSI I uses
>passive termination and that there could be compatability problems.
>If this turns out to be my problem (assuming the SXII is passive)
>does any one know of a compatability fix ?

Not really possible, and not really necessary either. Active termination
is usually required for FAST SCSI II, - bearing in mind that SCSI II isn't
a 'thing' in its own right, and mix'n'match I and II is fine.

>**Could there be problems simpling connecting a DB50 to a DB25 device?

Not really - as long as your cables are right.

>Any comments are very much appreciated.....

Get a copy of ICD's SCSI program - comes with the PRO utilities, and have
a poke at the SCSI bus with just the peavy units connected, find out what
their IDs are, and whether they respond at all.

>Atari Mega STe. It's a 3.5" unit, and I thought "No problem. Just yank
>that Seagate (yechhhhh!) that Atari put in there, drop the Conner in, and
>run the Atari AHDI utilities to recognize it, format it and use it."

Several possibilities come to mind here since I've seen this before...
First, if the drive is SCSI II only, it's quite possible that the host
adapter built into the MegaE won't deal with it. Second, some of the
newer harddrives come with a set of jumper pins to disable parity, but
they are functionless (and the techs at the shop will tell you they KNOW
it works, but it doesn't...) If either of these are the case, then
you're only hope is to attach the drive externally with an ICD Link II.

Well here is info about ICD's Pro utils..

NOTE: This could be out of date, ICD does not support there
customers on GEnie these days to well...

***** P R E S S R E L E A S E *****

Rockford, Illinois, June 23, 1993 -- ICD, Incorporated, a leading designer
and manufacturer of Atari hardware enhancements, today announced a new
standard for the Atari ST, TT, and Falcon computers.

ICD SCSI Pro Utilities(TM) was designed to provide all Atari owners a choice
of SCSI and IDE peripherals with the hard disk performance and dependability
that they can expect from ICD, the leader in Atari host adapters on the
Atari ST.

ICD SCSI Pro Utilities is a complete software tool kit designed for anyone
who owns a hard drive on an Atari computer. This unprotected package
consists of the ICD hard drive software that was previously available only
in a protected form, a new comprehensive version of Cleanup ST, as well as
other powerful new utilities. The software is supplied in a packed format
on two double-sided diskettes along with a 75 page manual.

The core of ICD SCSI Pro Utilities is the famous ICD Hard Drive Software.
ICDBOOT.PRG is a fully configurable, high performance hard disk driver.
It includes read and write-back caching with variable buffer and block sizes,
write-back delays, user selectable boot partitions, the ability to skip SCSI
IDs or partitions at boot time, smart removable media support, Floptical
support, along with many other useful options. By integrating the con-
figurable cache directly into the driver, ICD has enjoyed an amazing speed
advantage over other hard drive packages and add on cache programs.

HDUTIL is the utility program which allows the user to select the boot
partition, to zero or wipe a partition if desired, and to map out bad
sectors. HDUTIL is also the main configuration utility which easily and
logically allows the user to set the many options in ICDBOOT, the hard disk
driver.

ICDFMT is the preparation utility which is used to set up a new hard drive
or to change the existing partitions on a used hard drive. It also allows
the naming of partitions and editing of partition information. DESKTOP.PRG
allows the swapping of partitions with drive letters.

SCSI.PRG is an advanced command tester and sector editor for SCSI and IDE
devices. This powerful software offers the tools to troubleshoot SCSI and
IDE device problems, to read, edit, and write sectors directly to disk, and

to perform any other function using the SCSI command set. SCSI.PRG includes comprehensive on-line help and the option to save and load command strings for later use. The strength of this utility is that all operations are done directly to disk without the installed hard disk driver.

Cleanup, which was once sold as a separate program, will analyze a diskette, hard drive partition, or ramdisk, to determine if it has been damaged and if so how to correct it. Cleanup will detect and correct a wide variety of problems in the File Allocation Table (FAT) and in the directories. Cleanup will search a disk for bad sectors and optionally use multiple checks on each sector to find intermittently bad sectors. You simply can't buy a better safety net for your data than Cleanup. Using Cleanup is like wearing a seat belt. Once you start using it, you will feel unsafe without it.

ICD SCSI Pro Utilities also includes an ingenious CD-ROM driver for ICD Advantage/AdSCSI/Link SCSI host adapters and SCSI-2 CD-ROM drives. This driver is MinT/MultiTOS compatible, and a copy of MinT is included on the disk.

The suggested US retail price for ICD SCSI Pro Utilities is $49.95. It is available directly from ICD or from better Atari dealers everywhere.

For further information, contact ICD Press Relations in the United States by phone at (815) 968-2228 extension 222 or by fax at (815) 968-6888.

ICD SCSI Pro Utilities and The Link are trademarks of ICD, Incorporated. Other trademarks are those of their respective holders.

3655. Supradrive Problems/Questions

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-03 14:59:03 UTC
From: vicb@clark.edu
Message-ID: <2v6jnn$e1m@clark.edu>
Source record: 31635

I recently purchased a used Supradrive, I'd guess it's about 6-7 years old (based on its lack of a clock). 20 megs. The SUPFMT and SUPUTIL programs are both copyrighted to 1987. This is my first hard drive.

1) Are there any more recent upgrades to these utility programs?

2) I've gotten some flaky behavior at times. Does anyone with experience with Supradrive units know if the drive mechanism can be replaced with a different unit, perhaps a SCSI? The formatter says I've got a Miniscribe unit and controller right now, if that helps.

3) Until today, the unit's been sitting on a card table (ie not terribly steady; a bit wobbly.) Could this be the cause of the previously mentioned flaky behavior? It took me several tries at formatting to get a 'clean' setup with no bad clusters.

4) What exactly is a cluster? How many sectors? It seems that whether I get 100 or 2 bad clusters, I get about a 1.5 meg loss in capacity on my C: partition (4 megs is the intended.)

Any help on these would be appreciated.

Thanks,

Victor Bruhn
vicb@clark.edu

3656. Second drive in the Falcon

3657. Re: PC 386 EMULATOR FOR F

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-03 16:38:11 UTC
From: Ari Feldman <ari2550@delphi.com>
Message-ID: <ZoxzJQz.ari2550@delphi.com>
Source record: 31636

I had PC-Ditto and did manage to get it running on my Falcon (well sort off). I used backwards and managed to get the emulator to boot DOS from the floppy. After that, I managed to get into PC-BOSS, an old DOS SHELL program. However, soon after that the emulator broke on my system - the screen text blanked out and the thing locked up. It wasn't worth the effort to bother with it after that. I had version 2.0 pf PC-Ditto BTW.

As for PC-Ditto, it was a classic ST program and to my knowledge, one of the first, if not the first software PC emulators. Although it was slow as sh*t, it was very compatible with most DOS apps and successfully emulated most of the PC-XT's hardware chips as well.

As for F030 emualtors, there's still Falcon Speed 286 that I heard was fast - but the 486 version may never come out from what I hear. Why did COMPO even bother releasing a 286 version when the 286 is so outdated?

Ari

3658. MANVIEW on Falcon MTOS?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-03 16:38:36 UTC
From: scotty@cais.cais.com
Message-ID: <2v6pic$hp6@sun.cais.com>
Source record: 31637

Hi.

I downloaded MANVIEW and attempted to set it up to display man pages on my Falcon, and it consistently claims that the MANPATH variable is undefined. First I tried calling MANVIEW.APP directly from BASH, where MANPATH is certainly defined -- "man" itself works fine. When that didn't work, I went into GEM.CNF and added "setenv MANPATH /dev/j/manual" there, and MANVIEW still couldn't find the stuff!

It looks as if MANVIEW was written to run under Gemini; could the environment be defined differently under Gemini?

Has anyone gotten this to work?

Thanks for any pointers...

OBTIP: Shift-clicking the process name under the Multitos menu is a great way to obliterate a process!

Ha, ha, ha! (read that more as a chuckle than a guffaw) If anything, there
is probably _too much_ stuff that plugs into the single internal Mega bus
slot:

- video cards (Reflex and Nova come to mind, plus several more...)
- Xtra-RAM 8 (to boost memory to 12 megs total)
- TOS 2.06 upgrade cards
- Atari's FPU accelerator card (68881, I believe)
- Gadget's MegaTalk board (for Mac SCSI and serial I/O)
- the Vortex 286/386 PC had a Mega bus adaptor

and this is just off the top of my head. If CPU's, FPU's, RAM, ROM, video,
SCSI, and fast serial ports are "not really used for much", I guess I'd have
to ask what else you might expect to see? :-)

> MegaSTE computers are a different story. There are several pros and cons:

Excellent writeup on the MegaSTE's, by the way.

3660. Controlling a video via an STE

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-03 19:07:19 UTC
From: andrewc@cogs.susx.ac.uk
Message-ID: <2v7297$8gd@infa.central.susx.ac.uk>
Source record: 31541

Is there a way to control a video camcorder via the STE? What I would like is to be able to set a time between each section of recording, so that the tape lasts longer than, say, the 30 minutes that they do. It's for a simple kind of servaliance (sp?) of my back yard, to see if anyone enters it that shouldn't.

I expect the hardest part is connecting the recorder.

But anyway, that's one for you atari tech wizards to think about.

Thanks for any replies, email prefered.

Andy.

While many people have pointed out the availability of NVDI and other
commercial GDOS replacements, I would like to mention AMCGDOS which
is available from atari.archive for free.

It does not speed things up, but it runs quite reliable.

I use a TT030 with a ZyXel U-1996E Plus, it is 19,200 baud, and can
compress the data for DTE through put of up to 76,800 bps.

I use STalker and use the number 2 modem port. With a modem cable
that has hardware flow control. You will not need to use any serial
fix program but you will have to expand the buffers when sending at
9600 baud and up.

The a serial patch program is included with STalker for use of the
number 1 modem port.

Another question concerning my recently purchased 20 meg Supradrive...

Can anyone tell me anything that will be of help in setting it up for a boot from drive C:? I've run the program SUPUTL to set the drive to do a hard disk boot, and I am booting with the Supra supplied boot disk, but I only get a hard disk boot some of the time (less than half the time.) Anybody out there that has any insight into this?

Thanks,

Victor Bruhn

I've found that _some_ Supra drives, when attached to _some_ STs, do not
like being IDed as SCSI device 0. Setting the drive to device 1 alleviated
the problem.

Strange. I had no problems updating mine, so I guess if one finds a used
copy the latest version can be obtained with an update. Toad and other
mail order companies still advertise it. I got mine updated just a few weeks
ago, and it is version 5.08. This version requires 6.5.x of the ICD software
(it comes with icdboot.prg).

There are two 'environments' in MTOS. The one each process inherits is
the MTOS one, which you set up in MINT.CNF.

The other environment is the AES one, which inherits the stuff from
MINT.CNF when the AES starts, and then modifies it using GEM.CNF. This
environment is never seen by processes unless they *explicitly* search
the AES env using the shel_ library.

So, set your variables in MINT.CNF instead of GEM.CNF.

It is not the main question, whether it actually (seems to) "works great", but whether it "must work because of its design".

My drivers provide nearly every (reasonable) service a user program needs.

> I didn't disable any interrupts. The only thing that I know of that will
> confuse the SCC is to write to it too fast.
And what happens if your program writes a register number (for the next read or write access) and now it is interrupted by an SCC-interrupt? I will explain it: The SCC-interrupt writes a register number too (he thinks to do so), but the SCC interpretes it as an write access to the register choosen by your programm, because after a write of a register number the SCC expects an access to the selected register. You can continue this error-game as long as you like. (There is a way to end this: One read from RR0. This is possible because RR0/WR0 can be accessed without prior writing the number. This read will deliver the content of RR0 if the SCC was not confused, otherwise the contend of any other register)

>How do I get at the Iorec of modem2?
Via XBIOS Iorec.

> Which device is it?
7

> And which number do I give Iorec()?
No number. Use Bconmap to switch to 7 and then back to the devices which was former setted. Or - but VERY CAREFULLY (check for pointers to NULL and odd addresses) by seeking thru the BCONMAP-list. The pointer to it provides XBIOS Bconmap.

??????????
Is there any server which I can access from Germany as anonymous at a normal time? If I try it, nearly all servers are full and do not allow anonymous access.

I just bought my Atari 1040ST last week and are quite excited about it.
Here is an inexpensive alternative to the DOS computers; what with
hundreds if not thousands of shareware out there. I plan to use my
Atari as a MIDI computer and there must be tons of good stuff available.

Speaking of shareware, I have a site with some MIDI software which
I would like to try out. How do I download this to my Atari?
Here is my situation: I have access to the Internet through my UNIX
account at work. I can FTP anything from any site to my workstation.
However, my Atari does not have a modem so the only way to down load
anything to it is probably through disks.

Any suggestions?

Thanks,

If your workstation can read/write DOS 720K disks then copy your FTPd software on to a DOS type disk. Atari STs can read/write DOS disks too. That way you can swap programs and data between your workstation and ST.

3680. RSVE German/English docs on a.a.u.e

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-04 17:43:12 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2v9hng$6h0@mailer.fsu.edu>
Source record: 31561
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just received a version of the RSVE instructions in both German and English from Harun Scheutzow (the author of RSVE and HSMODA0x). It is on atari.archive.umich.edu in /Utilities/Tosfixes/rsve_ge.lzh.

RSVE is a small board that can be connected to any ST (4 wires) that will allow one to use the ST/STE serial port (Modem1 on MSTE and TT) at much higher baud rates that before without data loss. The instructions include GAL programming information, negatives for board traces, etc. The fastest one can safely push the standard ST/STE serial port is 19200, which does not take full advantage of today's high speed modems. With RSVE, 38400, 57600, and 115200 datarates are possible. Several terminal programs (most notably CoNnect) directly support the RSVE extension. Other programs can use these higher datarates via the HSMODA0x serial port drivers.

Harun also offers prebuilt boards (very small, 33mm X 33mm), for those that do not have the ability to make their own. His contact information is also included in the file.

Source record: 31560

I have heard good things about this emulator. However, be aware that this emulator is software based - the plug-in-card doesn't have a 68000 chip on it. Rather, the board is meant for holding ST ROM chips. Since the emulation is done entirely by software, you will need a 486DX-50 and a decent VGA card to really run this thing fast.

Personally, I'm waiting for info on the JANUS hardware emulator - this has a ST on a card and uses the PC only to boost processing of video and input devices, etc.

On Thursday June 30th at about five to five
ai066@FreeNet.Carleton.CA (*Mark Montreuil*) happened to write:

MM>Will the PAK board work with the Mega STe? If so, how much is it, and
MM>where can us poor Canadian Atri users order this card?

Yepp, it does.

BUT: You'll need an adaptor from PLCC 2 DIL and with this adaptor
installed
the PAK won't fit into the original MegaSTE-housing. If you remove the PSU
it'll work, but a tower-case would be the better solution (IMHO).

I dunno the prices and I can't help you with a Canadian source, but you
can
contact the German developers:

Would you mind putting returns at the ends of your lines in the messages you post? They mess up my news reader and I can't figure out what you're saying.

Anyhow, what are you saying? To make sure that the SCC doesn't get confused, I should read RR0? Ok...

and to be sure that it doesn't interrupt and throw off my settings, I have to turn off interrupts? How do I do that? The sequence I send to the ship turns off interrupts while it's making settings and then turns them back on again.

Hi guys,

What are we all blabbering about, who would ever wants to use a PC emulator that runs wit a Norton factor of less than 1 ??? Soft PC sucks, really. I tried using it to develop a simple DBASE4 system but it is hopeless. We all are used to the 'speed' of the Atari and believe me, speed is addictive. At the prices of PC's right now there is just no use for emulators anymore.... (at least software emulators)

Yes, a SCSI floptical is ONE answer. However, it IS possible to
bring out a B: drive on the Falcon030. I don't know HOW, but I
do know a few people have done it -- Bill Rehbock @ Atari has
even suggested the possibility of using ultra-low profile drive
mechanisms to have two INTERNAL floppy drives (I think there's
even a few dual-drive mechanisms out there that will fit), but I
haven't heard of anyone going THIS far (it WOULD be nice, though!).

You got the US version of PC DITTO to run??? Hmmm...

According to Compo, they ARE still working on a 486 Falcon Speed
(and are even toying with Soundblaster emulation!), but it's still
a number of months away. The reason they chose a 286 version is
because it was fairly easy, less expensive, and about as fast as
a comparable 386 system anyway.

They're about to release an accelerator board for the Falcon, and
are expecting the 486 later this year.

You are not in need of writing another network-software. There exist a German programm MIDI_COM, which provides a very reliable net. A demo lays in German mailboxes. This demo has only one restriction: access only to A: and C: of
the remote computer. The full version costs 99DM.

MIDI_COM is NOT RESTRICTED to MIDI. It can use any other interface, if this interface is supported by a driver. For all interfaces supported by drivers
according to the specifications of SERSOFST.TXT (included in the HSMODA-package) I have an universal driver.

But the Falcon is a very slow machine (yes, really, I tested it myself! You may believe it or not, it is true). Without hardware modifications you will not achive high data rates. More than 38400Bd an the LAN of the Falcon are nearly impossible, because of the long worst case interrupt answer time. That means you can transfer nearly 3.5KByte/second on the net. On MIDI is a maximum of 3KByte/second possible. I will write a new driver software with a special handshake in the future allowing higher data rates, but at the moment I have more importand tasks to do: exams.

Greetings, HS

> Anyhow, what are you saying? To make sure that the SCC doesn't get confused,
> I should read RR0? Ok...
No. that is a way to get a confused SCC back to normal operation!

> and to be sure that it doesn't interrupt and throw off my settings, I have to
> turn off interrupts? How do I do that?
It seems to me that you program only in C or other high level languages.
That is bad. In assembler it is a easy sequence:

```
move sr,-(sp)
ori.w #$700,sr
;critical section
move.w (sp)+,sr
```

If you have a register free you may use it instead of the x(sp)x

You have to turn off the interrupts (in the CPU) to prevent the SCC from
becoming confused!

Is this message better? I pressed manually the Return-key and did not
relay on the automatical line wrap.

If anyone has a better newsreader for Indigo machines (running IRIX) I would
be happy to get a message.

Greetings, HS

3693. Re: RSVE German/English docs on a.a.u.e

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-05 10:11:01 UTC
From: s002893@YPSERV.rz.fhtw-berlin.de
Message-ID: <2vbbjl$ibs@RW320B49.rz.fhtw-berlin.de>
Source record: 31574
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Oh, Mickey, You make the RSVE better than it is. Do not wake up expectations it can not satisfy!

I will explain it: It is impossible to switch die MFP (which handles MODEM1) to a higher rate then 19200 only by software - if you like to use the asynchronous mode! You NEED this mode (more technical: the /16 divider) to synchronize on the async data your computer receives.
If you switch off the /16, you may transmit at more than 19200 error free, but the receiver makes mistakes, more or less, earlier or later. There are some ugly accessories and programs doing so.

RSVE generates higher clock frequencies and lets the /16 switched on.
The problem of synchronizing the data remains solved.

The next problem are uncooperative programs (as the Atari operating system, the TOS, really!) which disable the interrupts too long. (In some situations it is necessary to disable the ints, but keep such passages as short as possible!)

On an 8MHz-68000 ST with TOS2.06 and my drivers (with the FASTINT-option on, which "patches" a bit the most uncooperative part of the TOS) you can receive 57600Bd without any errors, as long as no hard disk access or keypress or mousemove occurs. Under Magic you can work (nearly) without restrictions while receiving at 38400Bd.

115200Bd error free is only possible on TTs or with a good CPU-speeder and a bit luck (the critical routines remain in cache or lay in the fast RAM).

There is a way to break the 57600Bd border on 8MHz machines too, but this is a bit more expensive than this RSVE.

Greetings, HS

Hi folks!

I am the original poster of the article concerning this subject.
In a few days, I'll post a summary of the info I've collected, so
be patient! :-)

In the meantime, I will give you a few addresses:

In the German magazine "ST Computer"(July/August issue) I found the adress to
a company called "edicta" which sells the PAK/3. A set costs 725DM, but then a
68030-50 and a 68882-50 is included. You must also upgrade to at least TOS
2.06. You can also buy the PAK/3 without CPU/FPU/TOS, and then it costs 320DM.

The address is:

edicta GmbH
Karl-Pfaff-Strasse 30
70597 Stuttgart
Germany

I also have a few addresses to companies that sell the HBS 640-T28 and the
HBS 640-T36, but from a lot of German fellows I've been adviced to buy the
PAK/3 instead.

The addresses are: Prices:

[Article crossposted from comp.sys.atari.st]
[Author was Rob S. Rice]
[Posted on 5 Jul 1994 18:05:24 GMT]

Hello!

A friend of mine just bought a new CD rom with a great many DOS clip art pictures upon it--in *.BMF, he tells me, color format. He would need to view and manipulate them as IMG files on a monochrome Mega 4 STE. Apparently the "trial" version of GemView hasn't helped him--although he intends to register the program anyway as soon as he gets one of the American addresses for that. Does anybody have any suggestions as to what he should do?

>Anybody have any ideas?

I was able to connect a Maxtor LXT340SY without any problems by:
setting the drive id to 0
disabling parity checking (by removing a jumper)
and basically doing a plug -n- go like you did. Should work ok.
Be sure to boot from a floppy that has the hard disk driver in the
auto folder or your utilities won't know you have a hard disk.

I could be wrong, but last I read Linux was being ported to the ST but
hasn't been completed. You can find MINIX and MinixFS and MiNT on
atari.archive.umich.edu.. or when that's busy, wuarchive.wustl.edu.
Get the Minix distribution kit for "ease" of installation.

```
] I will explain it: It is impossible to switch die MFP (which handles MODEM1
] to a higher rate then 19200 only by software - if you like to use the
] asynchronous mode! You NEED this mode (more technical: the /16 divider)
] to synchronize on the async data your computer receives.
```

The RSVE is a hardware modification! With a software driver for software not specifically supporting 38400, 57600 and 115200 baud on MODEM1.

I think Harun (the author of RSVE and poster of the original message :-) is
trying to say is that the 115200 baud setting is not usable on 8mHz machines,
and that 57600 is usable only if used used with a large disk buffer and mouse
interrupts disabled. In other words, he did not want folks to get the wrong
idea from my overly brief announcement of his product.

3707. Processor Upgrades for 1040STF

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-06 06:41:18 UTC
From: mattk@netcom.com
Message-ID: <mattkCsIAKv.8xL@netcom.com>
Source record: 31588

Hi all,

I'd like to know what is available for upgrading the 68000 in a 1040STF. There is the Adspeed 16mhz chip, but I've heard mention of other chip upgrades. I would appreciate any caveats, hints, horror stories and success stories.

TYo give an idea of what I have as far as other hardware, I am using an Adscsi pro, and a 2.5mb Xtra Ram upgrade. Most of the time, I use Storm as a terminal (can you use a 14.4k modem, port at 19.2k, while running a 68000 at 16mhz????). Outside of that, I will be spending a lot of time in Mint .95 using gcc.

If I have missed any variables, please let me know. Also, if you guys & gals have any recommendations of where is best to buy a named upgrade, I'd appreciate that as well.

Thanks in advance,
Matt <mattk@netcom.com>

Sorry, I don't have ascii-files of the original articles, but I've done
a summary on the PAK3 some weeks ago and I post it here again.

Recently there were some rumours about the PAK3-accelerator-board in
this group and I decided to give you more information on this subject.
Here it is:

Some information about the PAK3
==============================

First : It's hard work for me to do this in English and I hope you
appreciate it.

0. Disclaimer

I've nothing to do with c't magazine nor with any other
PAK-related companies.

1. General

The PAK3 is, as the name says, the third generation of an accelerator
board for MC68000 based computers. Its design has fully been published
by the German computer magazine c't, including the schematics and GAL
equations (issues 11/93, 12/93 and 2/94).

The board has been designed to emulate the MC68000 processors bus
interface at best, so it is not Atari specific but can used in Amigas
and Macs as well.

2. Now to the technical stuff...

There are two versions of the PAK3: One for an MC68020 processor, its
full name is PAK-68/3-020, and one for an MC68030 processor called
PAK-68/3-030.

Technically, both versions are the same, but have different PCB-layouts
with regard to the different pin layouts of both processors.
There are some advantages of the -030 version, though. You can use
the PMMU capabilities of this processor for memory protection and
virtual memory purposes. There is also a fast-ram (alternate ram)
option planned for this version. But if you 're only interested in speed
you'd better take the -020 board, because the MC68020 is much cheaper than
a -030. The -030 board has only a slight advantage in speed of
about 15% max.

3. More technical stuff...

the whole bus interface and all other logic (except two '541 drivers)
consist of five GALs, so every change in design can be made with new
GAL equations.

The 32 Kbyte second-level-cache (1st is in CPU) is made of four
CY7C185-25 cache-rams and two MK48S74-25 tag-rams (it's hard to get them!).
This cache is optionally, the same with a 68881/2-FPU.

There are also four sockets on board for OS-EPROMs, so that the CPU
has full 32bit access to the operating system.

Additionally there are some capacitors, resistors an oszillator and
a 74F86 for 8 to 16 MHz clock doubling.

You can use the PAK3 in two modes, the synchronous mode (16 MHz),
driven by the clock doubled 8 MHz from the mainboard, or the
asynchronous mode (32 MHz) driven by an oscillator on the PAK.
In my opinion there's no reason to use the PAK in the first mode,
except you have an overcritical designed mainboard (like the Amiga).
Note, that there are different GAL-sets for each configuration
(type of computer, CPU, mode)!

In most cases an Atari will also run with 36 MHz CPU-clock (asynchr.) on
the PAK, sometimes it will even run at 40 MHz, just change the oscillator
to try this out.

'Unfortunately', my PAK3 runs 'only' at 36 MHz in my Mega ST. 40 MHz runs
well after a warm-up time of about 15 minutes but it bombs in cold state.
It seems not to be a big problem so maybe I can fix this sometime.
There are a lot of 40 MHz PAKs around, running without problems.

4. Mechanics

To install the PAK you have to remove the old MC68000-CPU and solder
a 64pin socket in, where you can plug in the PAK. There's
also an option to install the old CPU onto the PAK with an additional
GAL. The PAK has the dimensions 152x89 mm and fits best in Mega STs.

It's difficult with the smaller ST's in the keyboard-cases because the
PAK is too high, the OS-EPROMs are piled upon the cache-rams.
You better build them into a PC-Tower. Adapters for ST's with PLCC-CPUs
are available.

The Blitter has to be removed or switched off, the new
processor is faster anyhow.
It's (always) recommended to replace the 74LS244 and 74LS373 drivers/
latches on the Atari-mainboard by faster 'F' types.

5. Software

You can run the PAK with Atari's universal TOS 2.06, which needs not to
be modified. Older TOSses cannot handle with CPUs > 68000.
But if you want to use the PMMU capabilities of the PAK3-030 you 'll
need a (patched) TOS 3.06 which supports the PMMU. There are also
difficulties with some harddisk-drivers on a PAK3-030 with TOS 2.06
because of uninitialized PMMU-tables, but AHDI works fine.
The TOS 3.06 patches are published in c't 2/94 and are available in
source code so it should be easy to adapt them to other than the german
TOS 3.06.

All well programmed newer Software will run on the PAK without
problems. Some games and software with loops for time-delays or
dirty tricks like self modifying code will have problems.

6. Costs

The PAK is thought as a do-it-yourself project. The PCB costs
about 100 DM, each GAL costs 10 DM if you don't burn it yourself.
Further costs will depend on your configuration (CPU-Type, with or
without Cache or FPU). There are some companies here in Germany
which sell also ready-to-use PAKs and parts-sets mostly with
cheap used processors. Parts-sets are about 550 DM and assembled
PAKs about 700 DM (both w/Cache and used CPU, w/o FPU and TOS).
Maybe you have cheaper sources of the chips, especially the CPUs,
in overseas.

7. Advice

This is absolutely NO project fo beginners! It's a 4-layer
PCB with approx. 800 pinholes.
You should only do it on your own if you would fly in a
plane you 've soldered yourself.

8. Benchmarks

I've chosen the fastest TT-mode as reference, because the TT
is the real competitor for an PAK-ST:

GEM Bench v3.40 ï¿½ Ofir Gal 14.1.94
==
ST TOS 2.06, MiNT not present
Blitter not present, NVDI not present
Video Mode = 640 * 400 * 2 Colours

```
LineF FPU installed
Run and Malloc from STRAM
Ref = TT + Fast RAM + FPU, ST High
PAK-68/3-030, no ACCs!, no AUTO-PRGs!
================================================

CPU-clock 32 MHz 36 MHz 40 MHz
================================================
GEM Dialog Box: 123% 133% 140%
VDI Text: 130% 140% 146%
VDI Text Effects: 127% 138% 146%
VDI Small Text: 138% 148% 156%
VDI Graphics: 120% 130% 137%
GEM Window: 115% 122% 127%
Integer Division: 99% 112% 124%
Float Math: 81% 87% 92%
RAM Access: 171% 192% 214%
ROM Access: 149% 168% 186%
Blitting: 84% 90% 98%
VDI Scroll: 105% 110% 114%
Justified Text: 125% 134% 140%
VDI Enquire: 109% 118% 123%
New Dialogs: 114% 122% 128%
================================================
Graphics: 117% 125% 132%
CPU: 125% 139% 154%
Average: 119% 129% 138%

my own benchmark : 494% 524% 570% (rel. 8 MHz ST!)
LKURZ (all three runs): 7'59" 7'40" 7'25"

My own benchmark is more calculation-based (sieve, sort, matrix inversion...)
in contrast to the GEM-graphics tests of GEMBench, but _without_ FPU-code.
You will gain some more performance of OS-routines if you use TOS 3.06,
because of some -020-code in it.
LKURZ is a typically speed test (german) for TeX, sorry for having no
8 MHz values but it's about 5 to 6 times slowlier.

9. Epilog

I 've done this summary because I think the PAK is the best thing you
can do for your Atari. Compared to the old 8 MHz machines, a PAK-ST is
really unbelievable fast. Even if you have to do fast calculations
there's no more need to buy a clumsy clone and dump your easy-to-use
Atari together with lots of well designed software. The PAK also runs
very stable and uncritical in comparison to other accelerator boards.
Most (all?) developers are on the net.

Greetings,
Stefan

Yes. Did I say other things?

>With a software driver for software
> not specifically supporting 38400, 57600 and 115200 baud on MODEM1.
No. Every software which is able to set MODEM1 to 110, 134 or 150 can use the high data rates. The driver provides more services than the TOS, and is much faster!

Greetings, HS

Multisession disks have the ISO format.

> * I manage to use the above to work on multi-session Photo CD's I've had
> developed.
>
> Comments?

Yes. Try the same with Atari's drivers and you'll see that you'll get only the
first session of the CD. -> It seems that Extendos *is* doing the multisession
stuff.

By the way: I know what I'm talking about; I've written a CD ROM driver, too
(both a BOS and a DOS driver).

> out their is running the same. Here goes.

Hmm, I don't know of which uucico implementation you talk. But it seems
you use the GFA uucico 3.72, usually works together with Hermes.

The latest version of GFA uucico is 4.01.

> How do you get it to use e-proto as a default OR use increased
> g-proto packet sizes? This has got me really confused. I call UUCICO72
> directly to place a call, all documented environment variables are set
> etc.. with the following command line:

You do not want to use g protocol over serial lines:

The `t' and `e' protocols are intended for use over TCP or some
other communication path with end to end reliability, as they do no
checking of the data at all. They will only be considered on a
TCP port which is both reliable and eight bit.

> It dials out just fine, connects (usually.. crappy phone line :),
> negotiates and logs in. However my end *SHOWS* its using e-proto
> as a default (I've included the lowercase 'e' at the end of the
> phone number in my hosts file).. My hosts logs show a NO negotiation
> for e-proto, and using g-proto with 64 byte packets. This KILLS
> throughput with the modem just thrashing itself to pieces.

The protocol and window/packet sizes really used for the transfer is
also dependent of the other host. If the other uucico is not capable
of the 'e' proto or does not want to use 'e' proto over the serial
line, there is no way to use 'e' proto.

> I've even tried g-proto with 512 byte packets. Nothing happens,
> UUCICO just sits their stating its gone into slave mode and does
> nothing. I'm really at a loss after 2 months of messing about with
> it. Please, HELP! :)

Again: The other site must support packet-sizes larger than 64 bytes.
If you want to use larger packet-sizes in *both* directions, the other
site has to configure that, too! And for GFA uucicos 3.?? you *must* use
the same packet-sizes in both directions. I don't know if the bug is
still present in 4.01.

Remember: Most old fashioned uucico-implementations do not support
larger packet sizes. Ask the other site for further information.

Bye,
Knarf

There was still no point in using a 286. If it's an Intel and it can't run
386 protected mode, its less than worthless.

Source record: 31448

Hi there!

Has somebody tried to connect a Mitsumi FX001 CDROM to an AtariST?
The Mitsumi-Interface is a simple 8-Bit-port with some DMA-stuff and
two address lines. The drive is capable of using a non-dma-mode (polling).
There MUST be a simple way to connect the duo.

Any idea is welcome, perhaps i will build the hardware myself, but i need
somebody, who writes a device driver.

Since the `critical section' code will read/write SCC registers, it should be obvious that all of the above should be run in super mode.

Regards,
Waldi (walra%moacs11@nl.net)

Yes, but a lot of Windows software will run (and run FASTER!) in
non-protected mode, so it's NOT worthless. There's also the
fact that Falcon Speed 286 is a PDS board and the Falcon's PDS
is only 16-bit -- it was just a MUCH easier and less expensive
project. The 486 board they have coming out may require some
soldering.

As a case in point, a Uk magazine reviewed it when it came out last year and
found you could run Word for Windows on it at a useable speed.

/ What Is OMEn? \
|
|
| The Open Multitasking Environment (OMEn) is an open architecture, |
| true preemptive multitasking operating system based on the 680x0 |
| processor family. It is also a graphical environment where the |
| user has free access to all commands and features, even while |
| running multiple programs simultaneously. |
| |
| OMEn is a modular system in which I/O function files are created |
| and configured without reference to the system core. It can thus |
| be interfaced with ease, and BY ANY DEVELOPER, to any type of |
| hardware and to any type of software protocol, existing or new. |
| This includes printers, disk drives and file systems, networks, |
| input devices, displays, industrial controls, MIDI, multi-media |
| and so on. |
| |
| OMEn is intended to run on most current 680x0 based computers |
| (Macintosh, Atari, Amiga) including older low end models; PC via |
| a 680x0 card; and new machines such as Power PC, Alpha IPX and |
| Pentium by 68000 emulation and other techniques. Implementation |
| progress for individual machines is detailed in issues of the |
| OMEn Herald. |
| |
| OMEn interface operation is nearer to UNIX X-Windows than to any |
| other interface, but OMEn's size is a fraction of UNIX, and the |
| generic object oriented drag-&-drop interface is unique. In |
```

| addition, A SINGLE VERSION of an OMEn application program or I/O |
| protocol interface will run on ALL COMPUTERS, making OMEn a much |
| more open system than UNIX in this critical area. |
_____/

Two Good Reasons To Write Software For OMEn

1. It is plain that under current market conditions, Atari and Amiga have become dead-end systems, and even Apple is failing to gain its share of the expanding market. The pool of 680x0 programmers is split into incompatible camps based on each proprietary brand of computer, while the pool of Intel programmers are all writing for the same non-proprietary systems.
OMEn will run on all 680x0 machines (including PCs with the 680x0 card, and RISC machines by emulation) independently of the fortunes of any one particular computer company. It is the only system conceptually capable of reversing the well-developed trend toward a closed Intel-Windows marketplace, and bringing good market share to 680x0 based and open architecture systems.
OMEn will be viable on almost the entire installed base of existing computers, from the oldest 7 MHz monochrome Macs without hard drives to the latest mega-feature machines. The potential market area for OMEn software is thus set to the widest possible limits, and developers who start early will have a head start on penetration of the platforms not covered by early releases. This could propel small companies from fringe markets to advantageous positions in major markets.

2. There's just one operating system to know for any and all machines, and it's a straightforward, easy to learn and use system. OMEn software makers will not have to know a variety of systems to hit all the potential markets for a program.

OMEn General Progress

Conceptually, only configurable bootup remains to be tackled for a complete open architecture operating system. It is intended that a text based "Boot Script" somewhat akin to DOS'es CONFIG.SYS and AUTOEXEC.BAT will be used to install desired I/O drivers, preferences, startup applications and miscellaneous at boot time.

A scaleable font handling system is now in place. It currently manages certain Postscript Type Three fonts which use a simple text based definition system editable with a text editor. These fonts are easy to add extended character definitions to. They mesh neatly with the rest of the scaleable graphics system, which uses the same definition format, which we call "ZipScrip". An example of an object defined by ZipScrip is:

```
n New object
0 200 m Move to co-ordinates 0,200 (X,Y)
0 700 l Draw a line (from 0,200) up to 0,700
```

```
100 700 l From there, line right to 100
500 700 500 200 100 200 c Then a big curve back to the bottom
e End polygon with a line back to the start
f Fill it in. It's a filled in "D" shape.
```

On a similar note, the "code page 437" character set (the IBM extended character set) has been adopted as characters 256 to 383 (hex 100 to 17F) of the OMEn character set. Character codes 384 to 1023 (hex 180 to 3FF) are currently reserved. The single byte defined character set is:
0 to 15: Control Characters (End of File, NewLine, Wordwrap, etc)
16 to 31: Extra OMEn printing characters (arrows, checkmark, etc)
32 to 127: Regular ASCII printing character set
128 to 255: Various non-printing commands (SetColors, bold, italics, SetTabs/Margins, PrintExtendedChar(>256), SetFont, ...)

Release Dates

The OMEn release for ATARI with development tools and documentation is still planned for 2nd quarter '94, probably in April. Please reply to receive your copy!

A preliminary MACINTOSH release for 512K, Plus, SE, Classic, SE 30 and Classic II will also be available upon request at that time. (The Classic III hasn't been tested.) Monochrome displays ONLY, of any size, will work, and Mac hard drives are not accessable. 68030 based machines with color or shades-of-grey displays are currenly not working, even if set to two-color mode in the "Monitors" control panel. OMEn starts up fine, and applications run okay, but everything "freezes" after about 20 to 30 seconds. (Ideas are welcome.)

The same OMEn software runs on both the Atari and the Mac. Since Mac Plusses can't use standard format DOS disks, a special feature called "DOSsify" has been added to convert an 800K Mac disk into an 800K DOS software compatible disk that works only on Macs. Transfer of software from/to real DOS disks must be done running OMEn on a Mac that can read both formats.

Development Tools

The current tools for software development within OMEn include a general purpose word processor (editing code, documentation, writing OMEn Herald, etc.), a structured 68000 assembler, debug monitor and a simple paint program for making icons, etc. The crash (/debug /breakpoint /single-step) window in the OMEn system is also very useful. Although they are separate programs, OMEn features allow the cursor in the word processor to jump instantly to compiler errors found in assembly. Documentation includes "The Software Development Process with Eazy-Asm" to quickly introduce you to the most effective use of these simple but powerful tools. Source code, documentation, debuggers, and the program under test can all be on screen at once.

In addition, Atari-GEM format programs (sorry, NOT GEM programs, just the GEM executable file FORMAT!) will work with OMEn, making it possible to use GEM based compilers (Assembler, C, Modula2, Pascal, etc) to write OMEn software. The development setup would include an Atari computer running the compiler to create the program, and any computer running OMEn to test it on, with a floppy disk being used to transfer the program to the test machine. Until appropriate interface libraries are created, a bit of in-line assembly will be required here and there for OMEn system and I/O calls.

GEM based compilers could be modified with relative ease by their creators to run in OMEn, where they would work on any OMEn machine as well as Atari!

OMEn for PC

Since OMEn is a 680x0 based system, it does not run on Intel processors directly, but the strength of the PC architecture is that new hardware can be added on bus cards.

OMEn for the PC is currently under design with a 16.68MHz 68331 card. This is equivalent to a 22.24MHz 386SX because the '331 takes three clock cycles to access memory while the '386 takes four clock cycles. The PC does all the I/O including video, and the card does internal processing. In PC terms, the top speed of the system would be the speed of the PC plus 22 MHz!

The prototype card will be ready in the next month or two, but it will take further time to get OMEn running on the PC. Two DRAM SIMMs (30 pin, 8 or 9 bits wide) are required. SIMM size may be from 256KB to 8MB, giving 1/2 to 15MB (the card's limit) of memory. Odd size SIMMs (512K or 2MB) will work.

The card has an 8 bit stereo/16 bit mono audio output, a serial port (Appletalk compatible?), and a special synchronous serial port for control applications. With some restrictions, the memory on the card can be used as DOS/Windows extended memory if OMEn is not in use.

System Tidbits: Writing an Application

We had planned to feature the dynamic memory/file management system, but patent considerations preclude it this month, so here is another topic: The steps to writing a typical OMEn application.

The structure of a simple OMEn application can be as follows:

1) Title, copyright, and includes (include OMENEQU.TEXT)
2) Define storage requirements for scratch memory
3) Initialize the program
4) The Event Loop
5) Subroutines (as required)
6) Place or VInclude Constants

Initialization (3) can be broken down as follows:
a) Open a window (or menu/dialog box). This is a simple step

requiring five machine language instructions, which includes checking for error.
b) Open and initialize scratch memory as required. Opening (allocating) memory is also a simple proceedure.

The event loop (4) should handle at least the following events:
a) #CloseWw (Close Window) If there is only one, the appropriate response is to end the program.
b) #RedrawWw (Redraw Window) The display protocol manager sends this when a window is in need of updating, including when it is first opened.
Some other events that are commonly handled are: #<$400 (text/keystroke event), #Click (mouse), #DragFile (open file or ?), and #AboutWw (tell about program or window). There are many more events such as #TaskClosing (another program shutting down) and #DisplayAttrChange (change of display mode or zoom) which may be handled or ignored as desired.

The constants section (5) includes such items as menu text and window definitions. Whole files such as Icon pictures or digitized sounds can be inserted into the program with the structured assembler's VInclude (Verbatim Include) feature.

These steps are all simple. An example runnable program can be as short as 1/4 page of assembly code.

Next Issue (April)

Atari Release Notes. More good reasons to write software for OMEn.
Real-time Control.

OMEn General Progress

A name has been coined for one of OMEn's major features: it's "componentware". Componentware was the feature article in April BYTE magazine. OMEn is a componentware operating system where applications and I/O managers become components of the system as a whole.

OMEn for ATARI has been released and the OMEn software development system will be ready by the time you're reading this.
Virtually all attention for the past four months has been focused on getting out OMEn for Atari and the OMEn software development package, and the documentation required for these. There was no OMEn Herald in April.
Now that this project is complete, attention can be focused on portings to other computers and system and utility software improvements, as well as promotion and business contacts and contracts.
The latest new improvement, just completed, is the ability to save video display mode and view size preferences for restoration next time OMEn is run. The first version Laserjet laser printer driver is also completed. Next on the agenda is improvements to the Text Ed program.

Mac: The 68030 problem has been solved. Some newer model Macs, and some types of displays are still being uncooperative. The four main work areas to bring out a fully functional Macintosh version are (1) Colour Displays. The driver will be in the works shortly. (2) HFS disk management. (3) Solve the compatibility problems. (4) Misc.
The same OMEn software runs on both the Atari and the Mac from GEM/DOS disks.

Amiga: Although some routines are working, the Amiga porting contractor has been too busy with other work to complete his assignment, resulting in much delay to the Amiga version.
The demise of Commodore leaves just three distinct systems in the low-cost spectrum of the computer manufacturing business: Atari (barely), Apple, and PC compatibles. The few low-volume Unix systems at the higher end don't seem to run each other's software.

PC: The prototype circuit card has been fabricated but is not yet tested. The PC end software has not been written. A contract with a local software company for this work is pending further discussions. If it goes through or other arrangements can be made, the PC version could be out in three to six months; otherwise, it has a lower priority than the Mac and Amiga versions.
Enthusiasm for OMEn related contracts by local companies should improve as OMEn starts to spread around and third party software is in the works. (Yes, there are interested developers.)

ReleasED Date

OMEn for ATARI (version 2.46) was finally released on "D-Day" (Demo-Disk-Distribution-Day), June 6th 1994. This was later than planned, but it seems like a fitting day as many copies went to Europe. OMEn

2.46 is greatly improved over the late March rendition previewed for June Atari ST Review magazine, and 2.47 is still improving.
To receive the FREE demo or to order a licenced copy, just call, fax, or write. You can leave a message 24 hours a day, and it is safe to leave a credit card number. The demo is also available for downloading in archived form on GEnie and a number of local bulletin boards in different areas.

Three More Good Reasons to Write Software For OMEn

1) Because of OMEn's modularity, third parties will be able to write software protocol managers and I/O port drivers for any protocol, device or I/O system just as easily as writing application software. For example, if you think Esquimalt Digital's audio manager isn't very good, or you'd like to have audio run through your "Super Stereo Atari Cartridge" port instead of the internal system, that's a market opportunity instead of a compatibility problem. All audio in existing or new OMEn software can be re-routed through your system. Or, you could write a file protocol manager for Mac(HFS), Amiga, Unix, ISO9660 CD or Photo CD disks if you've worked with one of these disk formats. Or support Novell Netware, or currently unsupported printers? Anything but the small OMEn Core (copyright, patents pending) is fair game.
Companies locked out of creating useful system level software products by current closed systems can gain a stake in their best areas of expertise with OMEn. Those making hardware accessories will have the ability to make their products compatible with existing and new software. OMEn users will be much less dependent on one company for improvements to the system as they are with other systems.
PS: We'll sell source code for adaptation. Divide the size of the object file by 100 to obtain the price in Canadian dollars. I.E. the Dot Matrix Printer protocol at 4048 bytes, would be $40.48.
* * * * *
2) OMEn makes assembly language portable. The biggest argument against coding in fast, compact assembly language is that code isn't "portable"; source code for programs can't be transferred from one machine or system to another. Since OMEn runs the SAME software on all machines, this will no longer be an issue.
* * * * *
3) Poised for the future: Although OMEn is a 680x0 based system, it is possible to write I/O managers (as well as applications) in the language of any new RISC chip: Pentium, Power PC or Alpha IPX. It is intended to create cross-assemblers which will take Eazy Asm 68K source code and render RISC machine code for these systems instead of 680x0 code. This will generate full-speed drivers without source code changes.
In addition, these new systems are capable of running 680x0 software by emulation. Other systems which have both a 680x0 and a RISC chip or a DSP can off-load I/O managers onto the non-680x0 while the applications' instructions are executed on the 680x0 to yield OMEn multi-processor systems of "blinding" speed.

And although new RISC systems are in the news, older machines still form much of the software market. It will likely take some time for the new models to become a major share of a computer market which is already somewhat saturated.

System Tidbits

Working With Bitmapped Pictures

The "_ConvertBitmap" system call converts bitmapped pictures between different numbers of colours and scales them to arbitrary sizes. Printer managers use "_ConvertBitmap" to generate an appropriate image from a picture that they couldn't otherwise print properly. The Colour Dot Matrix Printer protocol converts colour pictures to 16 colours at 80 by 72 DPI, using slight patterning for three of the colours. (People who see the pictures often think that they are colour inkjet printouts.) The first version "Laserjet" protocol converts all pictures to black & white, 300 DPI. The next version is to have a patterned gray scale at 150 or 100 DPI for colour pictures. Currently there are no dithering options when converting bitmaps to a lesser number of colours. The 16 colour palette was mathematically designed. It does quite a presentable rendition of many 256 colour pictures. The four colour palette often does a fair monochrome showing of colour pictures as well.

In addition, the "upward compatible colour palette" system allows four colour (four shade) bitmaps to display on a 16 or 256 colour device, and 16 colour pictures to show properly on a 256 colour palette. Two colour images can be shown on any display or printer in any available colours. A coming version of OMEn will handle true colour.

GEM/DOS Disks With OMEn

OMEn's DOS Disk File protocol uses any GEM or DOS partition on a hard drive and any GEM or DOS format of 3-1/2 or 5-1/4 inch floppy disk on any machine including Macintosh.
Fourteen character file names, four character file extensions, and file version numbers are permitted by making use of the ten unused bytes (!) in a DOS file entry. Upper and lower case names are allowed.
If an OMEn file is copied or viewed from GEM or DOS, the extra information simply disappears and the remaining file name becomes upper case. Two minor compatibility problems occur: (A) when shortening the file name to eight characters causes a duplicate file name, and (B) some systems can't read lower case names (e.g. Falcon). Both problems are easily remedied by renaming the required file from OMEn and are minor beside the benefits.
The OMEn system itself defines file names up to 47 characters plus additional file information, which is optionally saved to GEM/DOS disks within the file itself.

Industrial/Home/Office/Shop/Lab Control

It is intended that OMEn be an excellent system for controlling things. An OMEn control system could run HVAC (Heating, Ventilation and Air Conditioning) equipment, fire alarms, security, lighting, school bells and synchronized clocks.
A PC card with its own power and battery backup are planned for the future to provide high reliability, round the clock control for homes, schools, offices, labs and factories. Another company in Victoria is considering using OMEn in a proprietary MC68332 based control system.
Graphical interface software to set up controls will allow any computer literate person to program and schedule these systems. This means the control system can be mass-marketed instead of being sold mainly to trained installers who are able to program in if-then-else BASIC like languages as is the case with current systems.

This is the last letters that have been posted on GEnie so far....

I will try and get the Demo uploaded on A.A...

Seit einem Blitzeinschlag ist die RS232 von meinem Atari 1040STFM
halbseitig gelaehmt. Senden ok, jedoch RxD (PIN 3) will nichts mehr
empfangen.
Kennt sich jemand damit aus ? Reicht es irgendein IC zu ersetzen ?

Bitte Ratschlaege per e-mail an mich.

Gruss,

Guido Hoffmann
(gh@meteo.Uni-Koeln.DE)

: Hi,

: I am hoping that someone can help me with this problem; I want to add
: items to an existing object tree. For example, I load the resource file
: into memory using rsrc_load() and then decide that I want to add twenty
: icons to the first tree.

Hallo Michel,

obj_add does only establish the references between the objects in a tree,
i.e. references from the desired parent object to the added child object
and from and to the sister objects. The record/data of the object to be
added must already be available in the object array. In your case,
after loading an object tree from a resource file you have to allocate a
buffer which is big ennough to contain the object tree and the objects
you want to add. Then you have to copy the object tree and now you can
add an object which is not already in the tree as long as the provided
object index identifies an object which can be located in the allocated
buffer. You need not to initialize the object before objc_add, this can
also be dawn afterwards.

Hope I could help,
Greetings Reiner Plaum.

> expecting the same FAT and partially written file.
>

Presumably the attitude of the OS-developers is that if your diskette has a flakey sector at format, you shouldn't even be contemplating using the disk at all.

Several utilities however _do_ mark bad on FD format (Harlekin.ACC to name one). Also, varying the format style (10 sector / 9 sector) may allow a correct format.

That said, I generally make the same judgement, i.e. trash any (rare) disk which gives this problem. Nowadays this usually means any 5+ year-old archive diskette that I look at and decide to reformat, but which won't.

Of course, in practical terms, a "trashed" disk is normally reprocessed as a much lower density medium for my Sinclair Spectrum Opus drives and works fine for my young kids and their games on that machine...

Just to clear things up here ... the current version of ExtenDOS does
NOT support multisession (I should know, I wrote it). The next version
will, to the extent that I can get info from the manufacturers on how
to access sessions after the first ...

I am having a problem getting 256 colors at 640x480 on my Falcon. I have an IBM PS/2 Model 8513 VGA monitor and I get 16 colors at 640x480 just fine. Does anyone have any ideas? Could it be this monitor just can not do it?

Also, Is there any way to go bigger then 640x480? I have heard about BLOWUP but is there any other way?

3734. ICD Utils, >16mb partitions, and optimizing

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-08 09:31:26 UTC
From: mattk@netcom.com
Message-ID: <mattkCsM7sE.6t1@netcom.com>
Source record: 31466

Hi all,

Ok, first some background. I have a Maxtor 120mb scsi drive that I use with my tos 1.0 st. It's divided into partitions c-h, and i which is a 32 mb minix partition. I'm running out of space and want to get another scsi drive of about the same size (btw, where can one get scsi drives of oonly a few hundred megs--most I see are around 500 mb). SO I read in the ICD manual I got with my Adscsi that you can have up to 3.5 gigs using what I'll call logical drives (250mb logical partitions, 14 of them).

Now, the manual says that "big GEM" or BGM partitions can't be booted, and programs that expect 512 byte sectors may have problems. First, what programs would likely expect 512 byte sectors? My only guess would be an optimizer might. Second problem would be if you wanted a 250mb partition, you'd have 8k logical sectors. This would be wasteful when it cones to small files, right?

I guess I'd like to know if anyone is using BGM partitions on a daily basis. The Minix filesystem driver seems to not mind BGM partitions, since my minix partition began its life as a BGM. And, do optimizers work correctly--such as Diamond Edge--with BGM partitions. Or does ICD offer an optimizer...?

Bye for now,
Matt Koundakjian <mattk@netcom.com>

3735. PHOTOCROME 4 Patch...

***** PHOTOCROME 4 *****

I have just had a look at this Patch for Photocrome 4,
so that is can run at 16mhz on a Mega STE..

This is the command that is wrong.. cmp.l #00020010,0004(a0)

First the software looks for the Machine Type Cookie _MCH
then at the cookie machine type flag bits....

00020010
^ = STE
^ = TT

00010010
^ = Mega STE

So this patch is simple, some one just got the machine type flag bits wrong.

I don't know if its posible to patch it for the ADspeed, but I do intend to
give it a try.....

P.S. After loading Photocrome into the Raid Debuger, I did a search for the
00020010 string, there was only one occurence...

Hope this helps.....

Ulrich

3737. More Atari Newsgroups !?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-08 11:38:05 UTC
From: tj@aiscube.AIS-dortmund.de
Message-ID: <2vjdqt$p8p@aiscube.AIS-Dortmund.DE>
Source record: 31468
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello Atari-World

Although there has been some disussion about more Atari-related Newsgroups
in te Usenet lately, it seems that most activities concerning this Idea
are obviously lost. Anyway, any time i look at the comp.sys.* or comp.os.*
areas i sometimes feel a little unsatisfied with just three or four
Atari-Groups, while IBM'ers and Amigos/Amigas can read and write in a lot
of "Special-groups" related to their machines. What is it, that all
Atarian's in the Usenet use such a relatively small space to communicate ?
Is it that most of us are satisfied with our small area here, or is it
the work which has to be done for creating a new group ?
Don't get me wrong, it's not the idea of "if IBM'ers and others have the
right to have such a lot of Groups, we do also !". But meanwhile, i believe
there are some good reasons to have more Atari-Groups. Except the work
of CFD/CFV and so on, which has to be done, i cannot see any disadvantage
in having more groups, but maybe i'm wrong ?! it's just my personal opinion.
For that reason, here is an idea of what COULD be done:

(Note: it's just my personal idea, perhaps someone has a better solution)

Following Groups:

1) comp.sys.atari.st /* already there ! */
2) comp.sys.atari.st.tech /* already there ! */
3) comp.sys.atari.st.advovacy /* already there ! */
4) comp.sys.atari.st.hardware /* Hardware related topics */
5) comp.sys.atari.st.software /* Software related topics */
6) comp.sys.atari.st.programming /* Programming the Atari's */
7) comp.sys.atari.st.mtask /* All about MiNT/MTOS/Mag!X/Geneva */
8) comp.sys.atari.st.games /* Games and Fun */

Although (1) should still be ok for non-technical disussions, (2) is a litle
bit difficult to "insert", because everything could now (and better) be
directed to (3) - (8).

Well, Atarian's, what do you think ? Is it worth to think/talk about or
do you think i'm totally crazy ? :-)

This DOES work!

I have a MSTE and used Michtron Utilities to search for "00020010".
Just one occurrence. I changed it to "00010010". It now does all its
"work" in 16MHz and then switches automatically to 8MHz to display the
pictures! Do it!

>4) comp.sys.atari.st.hardware /* Hardware related topics */

I would vote for this, but wonder if you should tag it ST? I would
be greatly interested in any hardware hacks, projects, for my
Falcon, as well as an STe that I dont do a lot with...

>5) comp.sys.atari.st.software /* Software related topics */

Probably not so useful, since c.s.a.st would be the place where most people
would discuss this. If this exists, what would the 'root' c.s.a.st
contain?

>6) comp.sys.atari.st.programming /* Programming the Atari's */

Sure, I would love to learn to program my computer, considering the
lack of (new) books that are on the general market for the ST.

>7) comp.sys.atari.st.mtask /* All about MiNT/MTOS/Mag!X/Geneva */

dunno if this one is a good idear, but cant see any reason why not. Might
want to see if the 680x0 (Atari-Specific) peoples working on the Falcon/TT
Linux would like this, as I wouldnt mind seeing my Falcon running
Linux...

>8) comp.sys.atari.st.games /* Games and Fun */

indifferent...

>Well, Atarian's, what do you think ? Is it worth to think/talk about or
>do you think i'm totally crazy ? :-)

shrug I think the topics come up before, but not too many people have
expressed interest. If you do a formal CFV or CFD, make sure you cross-post
into this newsgroup, otherwise you might miss out on some votes.

Actually there is, have a look at the `inline calls' section of the
manual, which describes the usage of `#pragma inline'. It's by no
means as comfortable as gcc, so it might be easier to put the asm
code in a seperate (.s) file.

Buy a Computer Shopper magazine, and look at the Dirt Cheap Drives ad (really).

Only very old disk utilities (Cheetah comes to mine, but it has other
horrible bugs as well). You probably don't have to worry about it if you
have kept your utility software fairly current.

> My only guess would be an
> optimizer might.

This might be true. Diamond Edge does not have any problems with BGM
partitions, and is must-have software for hard drive users IMHO.

> Second problem would be if you wanted a 250mb
> partition, you'd have 8k logical sectors. This would be wasteful when it
> cones to small files, right?

They are more wasteful than 512 byte sectors. Such is life :-). I don't
think it will be a major problem (or even noticable). You would probably be
better off making a few smaller (but still large) partitions. Of course,
your boot partition must be non-BGM.

> I guess I'd like to know if anyone is using BGM partitions on a daily

> offer an optimizer...?

I use them all the time, and they work fine. I was apprehensive at first
myself, but I have been using BGM partitions for a couple of years now with
no problems. Anything made in the last 4 years or so (that is a guestimate,
I'm not sure when BGMs came out but it should be around there) won't have a
problem with them. Only programs that work with the disk at very low
levels are eligible for suspicion.

ICD are still updating the ProUtilities. My latest version is 6.5.5.
I believe the cost of updates is something like $10. Return your
disks with a check and they will send you out the update. On my last
update, they did hold off sending me the update since I was specifically
after the cd-rom drivers they were adding (new ones) so I had a wait of
about 2 months for the software to finally arrive. It was worth the
wait. I would guess by now there is potentially already a newer
version out than 6.5.5. Wayne

3748. Four questions: ProTracker, GemView color printers, more

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-09 18:48:27 UTC
From: paulseniura@delphi.com
Message-ID: <Zq9Qh17.paulseniura@delphi.com>
Source record: 31480

I'm posting this to a few places, sorry for the duplication...

A few weeks ago I sent e-mail via Internet to the person listed in the ProTracker v2.0s documentation. Haven't heard back at all yet. Curious if I should even try sending the registration fee from Oklahoma USA to Norway(!), if e-mail doesn't get thru to him, ya know. I have some detailed questions about what v2.1 will let me do, with my upgraded 520ST (Turbo16 & 4-meg w/ TOS 1.04 & Warp-9 etc.). I can play most MODs at 27 kHz, sometimes have to step down to 24 when it gets too busy (it'll stop & tell me automatically). No real bugs to talk about at all! So I'm merely wondering if they've been able to "push" it some more, and also give us the kind of 11-bit resolution found in PT-Player v1.02.

A similar question (for y'all who might know) is whether I can get/build something to give me stereo DMA sound a-la STE for my 520ST? Afraid to spend more $$ for a STE (assuming I can find one :) cuz I need OS-9 from Cumana & it might cease to work with an STE. And would love to come up with DMA sound drivers for OS-9, too, hint hint, but I hafta be able to just upgrade my ST by adding the DMA circuits to it. Note: not just merely stereo 8-bit DACs (like STReplay & similar hardware), but DMA as well.

A third question for the people who might know: I'm *very* adept in doing circuit upgrades (practically rebuilt & redesigned my CoCo3 system, see). So I'd like to do the "38400-bps" upgrade which consists of a single 74LS74 chip wired to the MFP. The IMG drawing & doc was written by Jurgen Meyer & can be found at the Atari FTP archive sites. Only part of the doc was translated to English. I've got a 74F74 & switch ready to go if someone could tell me how it's working for you, and what-all does it really affect, etc.

Fourth & last question: It's only been a couple of weeks since sending in my payment for GemView, so I don't yet have the full-working version. I'm very interested in getting Canon's BJ-600 I believe it is: their color bubble-jet printer with separate ink carts for each color. Contrast it to the HP-550C which has the 3 primary colors in *one* cart and a second one for black (similar to Canon's early low-rez color printers, which I also have one but with Tandy's ROM in it). If ya run out of only one color, gotta replace all 3, and that's a waste not to mention costly.

So does the BJ-600 work with the HP-550C drivers in GemView? Does GemView merely "print what you see on the screen"? I.e. I would need "full-color" printing rather than "what you see", cuz my ST of course can only do 4K palette & 16 color registers, maximum. So getting a

color printer (no matter what model) would be a big waste if all I can do is "print what I see", and I would consider my $30 payment to Cybercube a big waste as well. (but monochrome mode printing works real good with my BJ-200 using the NEC 180-dpi driver, but I want to use 360-dpi mode!).

Someone's going to tell me to "look at the BJ-600 book and see if it does such-&-such". I don't have access to the book, and the sales people don't know either; I need to know if _you_ know if it handles the codes for a HP-550C. :)

Thank you for your time. If you would, please respond privately as I may not see your response before the system wraps it off the list.

[crossposted from comp.sys.atari.st, where the thread originated, to
news.groups, since it's appropriate for n.g even though no decision
has been made about a formal RFD]

tj@aiscube.AIS-dortmund.de (Theo Janssen) writes:
> 1) comp.sys.atari.st /* already there ! */
> 2) comp.sys.atari.st.tech /* already there ! */
if there is a reorganization, these 2 groups could probably be
rmgrouped.

> 3) comp.sys.atari.st.advovacy /* already there ! */
note: it's comp.sys.atari.advocacy. no "st" in the name.

> 4) comp.sys.atari.st.hardware /* Hardware related topics */
> 5) comp.sys.atari.st.software /* Software related topics */
> 6) comp.sys.atari.st.programming /* Programming the Atari's */
i would personally prefer to see the "st" dropped from these names as
well, since the ST isn't the only computer discussed in c.s.a.st as it
is, and keeping the st in the names would be pointless if we're going
to create new groups.

> 7) comp.sys.atari.st.mtask /* All about MiNT/MTOS/Mag!X/Geneva
i'm not sure this is the best name, but it's a good idea. in fact,
i've been thinking of proposing a newsgroup for atari multitasking for
a while, independent of any other reorganization.

> 8) comp.sys.atari.st.games /* Games and Fun */
i'm not quite sure dropping the "st" from this one is as good an idea
as for the others, unless people are willing to put up with messages
about atari's game machines. i'm pretty much indifferent as to any
gaming group, though.

9) comp.sys.atari.announce, would, of course, remain unchanged.

3751. Help (STE owners)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-09 22:52:38 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2vn9nm$r9r@mailer.fsu.edu>
Source record: 31483
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

First, my request. I would to get several folks who own STEs of all different types to verify something for me. Basically, in color graphic demo Brain Damage, there is a disk load portion that plays a heartbeat sample over and over. On my MegaSTE, that sound crackles like hell. I believe this (and other crackling when using the DMA sound on my early model MegaSTE) is indicative of the GST Shifter bug that has been discussed on this group. I would like to verify this, as I need a positive test for this problem (see below for details).

So, to make it easy, I have put the Brain Damage demo on my own ftp server, along with everything needed to use it. This demo will only work with STEs in color (it is an awesome demo BTW, a must-have). If you would like to help me, simply run the Brain Damage demo, note if you hear lots of crackling during the heartbeat sample (it occurs for about 30 seconds, after the initial intro screen, before the demo proper), and send me an email mentioning what kind of system you have and if you heard crackles. I would be interested in the amount of memory you have as well. My email address is boyd@math.fsu.edu.

If you don't already have Brain Damage <grin>, ftp to ftp.math.fsu.edu (192.12.122.28) and look in /pub/atari. I have made it into four parts for easy tranfer by 720k floppies. Also included are lha310.tos (lharc 3.10) and msa_2.3+.prg, which can be used to uncompress the files and put them onto floppies. All of this stuff is on atari.archive.umich.edu as well, but it is always swamped with Atari folks :-). If you do not have access to ftp but would like to help, send me some email and I'll figure out a way to get the files to you.

Ok, now the long winded reason for this. Basically, after having just gotten the new version of Octalyzer (an excellent mod file player for the STE/Falcon), I can no longer stand the crackling. The previous mod player I was using did not make the crackling stand out too bad, but Octalyzer sounds so much clearer that the crackles really stand out (and they drive me nuts!). Again, the crackling is caused by the use of an older GST Shifter chip in early MegaSTEs. The fix is to install a newer revision GST Shifter chip.

I can buy GST Shifters from Best Electronics, but they don't know how to tell what revision they are (I need a rev. D or later). So, I called Atari. Based on what others had said on the net, I was not expecting them to be very much help. However, I was very pleasently surprised to find that they are willing not only to service my machine, but to do it for free (given that I am correct about it being an early model bug) even though the machine is long past warantee. They estimated that it would only take a week or

two!

So, I am getting ready to send my MegaSTE off for some work! However, I want to include something that positively shows that the problem exists (and that it went away, after they work on it). I'm not sure about what shape their service department is in, so I want to make it as easy as possible for them. Thus, my reason for the request above finally becomes clear!

Thanks a million billion zillion in advance for any assistance. In particular, if you are a MegaSTE owner, I would also be interested in the markings on your GST Shifter chip (especially if it doesn't crackle). If you don't mind lifting the small cover on the top of the machine, the GST shifter is the large square socketed chip right next to the upper left hand corner of the SIMM sockets. A small bit of the chip is underneath the grey metal shielding in the middle of the machine (not a part that has any markings on it). The writing will be upside-down. All of this is when viewed from the front of the machine, and only the small top cover need be moved to see it. Please do this only if you are totally comfortable with lifting that small cover. Just the information on crackling would help!

If, by some quirk of fate, anyone has information about how to identify the revision of the chip from the markings (Atari refused to tell me, but that is consistant with their policy), or if anyone has a dead 1040STE from which I can purchase the GST Shifter (my understanding is that only MegaSTEs received bad ones, and any 1040STE shifter will fix my problem), or if you have some other source for a GST Shifter chip, please let me know! I am still a tiny bit leery of sending my machine off to Atari, so I would rather fix it myself.

Hmm, I thought this was a rule, but I cannot find it in my ICD manual, so I suppose you are right. ICD does encourage one to have a small boot partition, because some old versions of TOS can apparently trash the C drive randomly, but it does not state that it must be a GEM partition.

3753. Objective C 2.5.8

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-10 08:20:37 UTC
From: ekl@sdf.lonestar.org
Message-ID: <CsptuE.11s@sdf.lonestar.org>
Source record: 31520

I've recently come up with a series of "objects" that would provide a simple and elegant GEM user interface for the ST. However, the ObjC compiler that I had (2.5.3) is no longer functioning and the libraries and headers are lost.

I need to aquire a new Objective C compiler (2.5.8 for MC68K) to both run on my machine and probably distribute. GEM and the NeXT work very similar, both are event driven at the OS level although on a NeXT the application object converts OS events into Objective C messages, I can do this fairly easily and there are lots of other little tidbits that I've found that I would like to put in.

User interface doesn't have to be 90% of your work, it can be 10%! Or less. Considering that the GEM standards are different from the NeXT standards I wouldn't think of trying to port the NeXT object hierarchy, although sine sort of "Interface Builder" might be do-able.

If you can help me get an Objective C compiler and the standard lib and run-time then PLEASE email me!!

Thanks,

Final comment: I just tried MetaDOS 2.40 with Ataris BOS and DOS drivers
with a CD 300: only the first session of my Photo CD was accessible.
Obviously, the driver has to use the special multisession inquire
functions
in order to access the full contents (my driver does that).

In response to your questions about the smaller SCSI drives, I recently purchased a Maxtor 345S here in Canada for about $400 Cdn. US prices should be somewhat less. I had to order the drive in, however, as most places these days seem to be only stocking IDE drives. Shop around as well: many dealers I ran into sell their SCSIs for between $50-70 more than equivalent IDE drives. I suspect some of this is due to the distributors' pricing, but as well, they tack on a premium for the order.

This will probably do you, on the left are the pinouts of the DB19 connector
(standard DMA) and the left the 24pin internal conector. Just look in the
manual for the actual function.

DB19 IC24(Internal)
1 - 2
2 - 4
3 - 6
4 - 8
5 - 10
6 - 12
7 - 14
8 - 16
9 - 18
10 - 24
11 - 1, 7, 9, 17, 20, 21
12 - 3
13 - 5
14 - 11
15 - 13
16 - 19
17 - 15
18 - 22
19 - 23

I hope this helps.

I have just aquired some simms I would like to wire into my Mega (I am still working on the memory upgrade I need and this may be a free solution.)

The simms are 72pin and contain 8 4x256K and 2 1Mx1 drams (2Meg total with 2 parity bits?) The simms are manufactured by Bufalo and marked 200X MC-A. I don't think these are standard PC style simms (they came from an Japanese Kanji PC).

What I need is the following:

a) The pinouts for the simm if known.

b) The pinouts for 4x256 and 1Mx1 ramchips (I can then check or work out the simm pinout.

c) The pinouts of the MC68000 so I can work out how to wire these into the ST.

d) What these simms will fit (and worth so I can sell them 4 simms in total) so I can then buy the 16x 1M chips I could then solder into my Mega.

Many Thanks,

Dave Halliday.

Hello,

I need help to find Atari Portfolio software, and equipment. If
anyone knows of a company where i can mail order from please reply
by E-Mail.

Thanks,
Darkwolf

Try this modyfication by Flemming B. Nielsen on the MFP.. It's works
perfect and you can controll it so you can shift to the original speed with
a program..

Msg #8 / 1-18 Time: 24 Jun 94 00:56:24
From: Flemming B. Nielsen
To : All
Subj: High Speed Mod ect.
---------[N.ST.FAX]---
This text is for those of you who want a high speed serial port (38400) on
a standard ST(E) and still want to use their modem as a fax reciever.

It all started when I decided to do the standard CD4040 modification to my
MFP chip to lock the port at 38400.
Allready at this early stage I encountered my first problem - I didn't have
a 4040 and neither did anybody else in my town.

Well I used to do a lot of electonics, so I tried to find a substitute.
All it needed to do was divide by 4, so I settled for a 74LS93 of which I
had plenty.

I quickly put my modified modification (wow, what a mod <g>) together and
it worked like a dream.
That is until I tried sending a fax to BT-FAX. +FCON came through without
any problems and BT-FAX started, but then it just stopped dead and did
nothing.
After several tests I came to the conclusion that the fax reciever part of
the modem can't handle 38400, but has to be locked at 19200 for the
fax-transmission to work.

Ok, I know that there are some good german mods with several high speeds,
but you had to pay for them - and I would rather build it myself if I could.

I ended with a cross between several mods and here is how it works:

I used a 74LS157 as switch between the standard MFP clock (just as the ST was built) and my 38400 mod. The switch is toggled by an unused RTS signal from the MIDI ACIA (something like TURBORS).

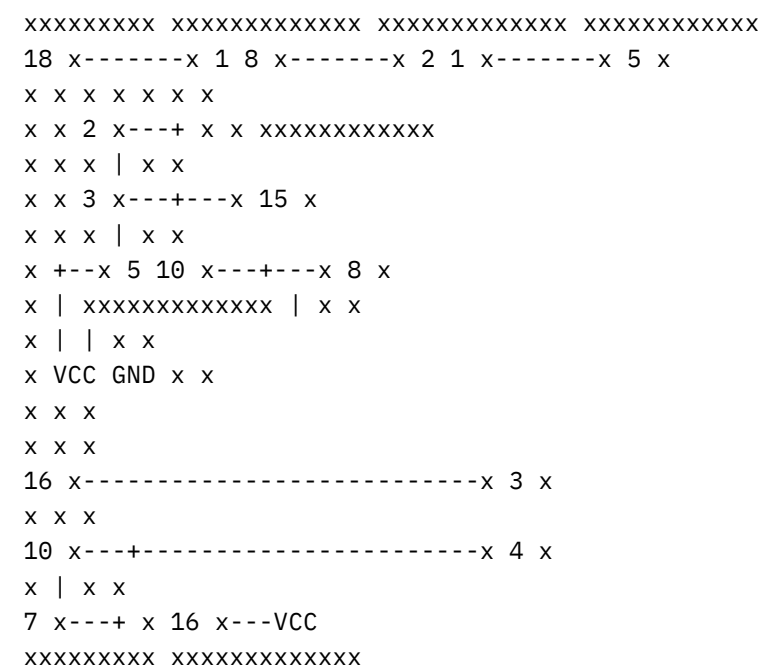
When the computer is switched on it defaults to 38400. When a fax comes in I call a program of my own that takes the name of the 'real' program I want (BT-FAX) plus its command line as a combined command line.
My program switches the baud rate to standard MFP (should be set at 19200) and calls BT-FAX. When BT-FAX is done my program reenables the high-speed mod.

It works just as it should - and its cheap.

==========
Here are the schematics:

All you need is a 74LS93 and a 74LS157 + some soldering skills!

You need to cut pin 16 on the MFP away from the circuit board.



In a 1040ST(E) the Midi ACIA is on the right side of the PCB and it is the one towards the back.

==========
And here is my software (Lattice C 5.5)

```
/*****************************************************/
/* set19200.ttp (c)1994 by Digisoft-Denmark */
/*****************************************************/

#include <portab.h>
#include <stdio.h>
#include <stddef.h>
```

```
#include <stdlib.h>
#include <stdarg.h>
#include <string.h>
#include <stdarg.h>
#include <ctype.h>
#include <xcrun.h>
#include <osbind.h>
#include <errno.h>
#include <dos.h>

#define ACIA_MIDI *(char *)(0xFFFFFC04)
#define TIMER_D 0xD5
#define BAUD38400 0x95

void set_baud_clk(int);

int main(int argc, char *argv[])
{ int retcode;

set_baud_clk(TIMER_D); /* enable TIMER_D */

argv[argc+1]=NULL; /* prepare for forkv() */
forkv(argv[1],argv+2); /* call the prog on the commandline */
/* + its parameters */
retcode=wait(); /* get its exit code */

set_baud_clk(BAUD38400); /* reenable 38400 */
return(retcode); /* return with the exit code */
}

void set_baud_clk(int clk)
{ long OldSSP=Super(NULL); /* enter SuperViser mode */
ACIA_MIDI=clk; /* set MIDI RTS */
Super((void *)OldSSP); /* exit SuperViser mode */
}
```

==========

In Semper I have 'SET19200.TTP' as the program and
'BT_FAX.TOS -pM:\ -m -g' as the command line.

Note! BT_FAX.TOS & SET19200.TTP should both be in the mailer folder.

==========
Addendum!!!
==========
A new little problem arised.

Semper will not send a EMSI handshake if Sempers portspeed is not
set a 38400 and you get a connect over 19200.
If you use HSMODEM and install the RSVE cookie, the data works fine;
BUT as SEMPER set the speed to 38400 and using HDMODEM the MFP speed
is actualy set at 110 baud - way to low for the fax.
There ar 2 solutions.

1) connect pin 11 from 74LS93 to pin 3 on 74LS157. Don't connect
pin 16 on the MFP to pin 3 on the 74LS157.
Now it will only switch between 19200 and 38400.

2) change HSMODEM to understand my modification or at least install
a new vector for RSCONF that understands my modification.

3765. Re: More Atari Newsgroups !?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-11 10:19:20 UTC
From: clausb@hpbbrd.bbn.hp.com
Message-ID: <Csru08.6K4@hpbbrd.bbn.hp.com>
Source record: 31517
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Given the relatively low (and dwindling) amount of traffic in the
current Atari newsgroups, in general I don't think it's worth the
effort to create new groups.

> 1) comp.sys.atari.st /* already there ! */

> 2) comp.sys.atari.st.tech /* already there ! */
> 4) comp.sys.atari.st.hardware /* Hardware related topics */
> 6) comp.sys.atari.st.programming /* Programming the Atari's */

These three groups will very likely overlap a lot. c.s.a.s.tech
already serves the purpose of a more hardware/systems-programming-
oriented group.

> 3) comp.sys.atari.st.advovacy /* already there ! */
> 5) comp.sys.atari.st.software /* Software related topics */

This is what c.s.a.s is for.

> 7) comp.sys.atari.st.mtask /* All about MiNT/MTOS/Mag!X/Geneva */

Most of these questions and discussions are also a perfect fit for
either c.s.a.s or c.s.a.s.tech.

> 8) comp.sys.atari.st.games /* Games and Fun */

You might get me with this one. Personally, I'm not interested in
discussions about games at all, so I wouldn't mind if there
was a separate group for it. On the other hand, I have not
seen many postings about games recently, so I don't bother
about them.

No, after thinking about it again, I don't think we need more
groups.

3768. atari st as controller without monitor

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-11 12:25:39 UTC
From: olava@ilf.uio.no
Message-ID: <olava-110794132539@129.240.43.233>
Source record: 31497

I have a atari 520 with a monitor, I wonder the cpu could be used as a home
automation computer (controlling through serial ports or midi-ports),
is it possible?
can work without the monitor beeing connected ?

could I use the speech program SPEECH as output, speaking?
if yes where must I connect the loudspeaker cables?

anybody that can satisfy my curiosity?

PS which simple shareware prog.lang. could do this work :
xlisp? pascal? ....

greetings from Olav-andreas.

Hi,

I have read about a (simple ?) upgrade to get the ST(E) up to 12 MHz.
It is supposed to be in a feature of ST_Format.

Has anyone this issue ?? Which one is it ??? I want to get hold of this !!

Regards Stefan

Self booting games are self booting, generally because they have on-disk protection. To get them working on a hard disk will require de-protecting them and probably messing around with the game loading routines - all non-trivial tasks. It can be done by hand but I don't know of any program that automates or helps much in this area.

3775. How do I turn off MIDI-thru

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-12 11:29:22 UTC
From: thed@mtek.chalmers.se
Message-ID: <2vtuqi$28c@nyheter.chalmers.se>
Source record: 31504

I've read the book 'ATARI ST INTERNALS' (Abacus Software) and the book about MIDI from the same company, but I found no obvious solution to my problem. Older STs seems to have MIDI-thru made by the hardware because when I read an old BIOS-listing, I found no place where the characters read from MIDI-in where written to MIDI-out.

The thing I did were to put the old op-codes (found in the old BIOS-listing) in an character-array and then I changed the read-interrupt pointer for the MIDI-device so it pointed to my array.
This works on my 2080ST but it will most certainly not work on the ST wich BIOS I have listed.

I would be most greatful for any help concerning this topic.

It is my understanding that usually the ST is NOT SUPPOSED to send the info
from MIDI-in to MIDI-out. Imagine the ST would write some data to MIDI-out and
at the same time would 'copy' some data that is sent to MIDI-in. Would be
quite a mess, wouldn't it. So I wouldn't assume that the ST has MIDI-though
made by hardware (altough I may be mistaken there).
In order to realise MIDI-though you'd either have to write a routine that copies
every byte from MIDI-in to MIDI-out or change the hardware to do so (I read that
it's quite easy, but I wouldn't do it!).

Hope this helps,

Guenther (donderer@informatik.tu-muenchen.de)

Well, both my ST and older once has MIDI-thru set to 'ON' when you turn them on,
and if it's not found in the software it's easy to assume that it's got
something to do with the hardware. I may have missed something when I read
'ATARI ST INTERNALS', but I really don't think so.

: In order to realise MIDI-though you'd either have to write a routine that copies

Personally, I think it would be great to start up some new, more specific newsgroups ... right now, c.s.a.s. is being used for everything not programming related ... (and even occasionally, programming related). c.s.a.s.t is mostly about hardware and programming ... and the new c.s.a.a. is a good idea. (Well, for us programmers it is. :-) I'd like to see some dedicated for games, for programming (specifically), and so on. It would make things a lot better, IMHO, and a lot easier to find out what you're looking for.

one) or for other information that can be interesting.

Loic

New since last version :
- Egon CD-Utilities
- COMPO Power CD
- 2nd CD from Bernd Lohrum
- M.O.S.T. viewer for Compton CDs

Updates since last version :
- MetaDos v. 2.4

ATARI CD-ROM FAQ

12/07/1994

1 - What driver should I use with my Atari system ?

There are several drivers available :

MetaDos :
Free software from Atari Corp.
Available from atari.archive.umich or ftp.muenster.de (metads24.zip)

The filesystem drivers support ISO9660 and High Sierra CDs, but not
multisession CDs.
The device driver only works for the Atari CDAR504 connected to the
ACSI bus or with generic SCSI CD-ROMs connected to the TT SCSI port.
(Answer from Julian Reschke)

CDROM.XFS :
Free software (Copyright 1992,1993,1994 Eric R. Smith, Michael Bernards
u. Gunther Leis)
Available from atari.archive.umich and other ftp sites.

This driver is a Mint extended filesystem and works on TTs and Falcons.
CDROM.XFS version <0.7 does not work with Mint/Multitos > 1.04.
The current version (0.7) is said to work on Mint/Multitos > 1.04.
It seems to be true on TTs but it does not work with any Mint version
on my Falcon.

CD-Tools :
Commercial solution from Hard & Soft, Obere Muensterstrasse 33-35,
D-44575 Castrop-Rauxel, Germany, Phone: ++49 2305 18014, Fax: ++49 2305

32463

Includes MetaDOS with GEM-based installation program, audio player with
PCM audio data import (only some drives) and custom devices and
filesystem drivers (support for Atari CDAR504 and generic CD-ROMs
connected to ACSI through host adapter, TT-SCSI, Falcon-SCSI,
multisession support (only some drives)).
(Answer from Julian Reschke)

With CD-Tools, you also have a GDPS module and the program Scan-It that
can handle Photo-CD Pictures.
CD-Tools is in German and costs 99 DM.

ExtenDOS v1.11:
Commercial solution from Anodyne Software, 6 Cobbler Court, Ottawa,
Ontario K1V 0B8, Canada.
Available in UK : System Solutions.

Support ST, STe, Mega, TT, and Falcon. Read ISO9660 and High_Sierra
CD-ROMs. It now runs just fine under MultiTOS with no restrictions;
memory protect is OK, and you can run programs directly from CD. It
also runs fine with Mag!X 2.01, with the restriction that the
EXTENDOS.CNF file must be in the root directory.

Extendos v1.11 costs $29.95(North Aerica).
(Information updated by Roger Burrows / Anodyne Software)

F030_CD :
Fairware from Peter Hilbring, Dietrich Ottmar Stra&#xfffd;e 16, 59597
Erwitte, Germany
Available on ftp.tu-clausthal.de
(/pub/atari/falcon/systools/f030_cd.zip)

This package includes a BOS driver for MetaDOS, MetaDOS 2.3, a
low level SCSI driver (TT & FALCON) and a program named
cd_explorer as exemple of the access of the low level driver.
(Info from Vincent Lefevre)

I've just tried these drivers on my falcon with an Apple
CD-300 cdrom and it works without problem.

ICD Pro :
Old versions came with a MetaDOS driver named ICDCDROM.BOS.
The new ones comes with a mint extended filesystem.

Egon CD-Utilities :
Commercial solution from ???; Available from several german
shops (Softhansa Gmbh, Untersbergstr. 22, 81539 Munchen, Tel :
089/6972206, Fax : 6924830)

Multisession MetaDos driver with audio-CD player.

Egon CD-Utilities costs 79 DM.

If you have some experience with this new driver, mail me.

2 - What discs are available ?

There are five Atari specific CD-ROMs :

GEMini CD-ROM :
From Walnut Creek CDROM, Suite 260, 1547 Palos Verdes Mall, Walnut Creek, CA 94596, USA, Phone: +1 510 674-0783, Fax: +1 510 674-0821, Email: info@cdrom.com, Ftp: ftp.cdrom.com
Available in Germany from Ingenieurburo Praefcke, Holtzvogtkamp 55, 24220 Flintbeck, Phon: (04347) 7531.

You can find the index of the GEMini CD-ROM on atari.archive.umich.edu.

Bernd Lohrum CD-ROM :
From Bernd Lohrum, Schlossbergstrasse 36, D-66440 Blieskastel, Germany, Phone: (0171) 4210222

There are two CDs from Bernd Lohrum :
Drachenstarke software : 300 Mb
Tigerstarke software : 500 Mb

Each CD-ROM costs 69 DM (59 DM for MAUS net users).

Wohlfahrtstatter CD-ROM :
From Wohlfahrtstatter, Irenenstr. 76c, D-40468 Dusseldorf, Germany, Phone: (0211)429876.
This CD-ROM costs 89 DM.

Power CD Volume 1 :
From Compo.
This CD-ROM costs 79 DM.

You can also use all the ISO-9660 CDs that exists for the PCs. You won't run the PC programs but you will access all the text, pictures, and sound files on it.
The discs already tried are :

Corel Artshow 91 :
~ 1000 scans of paintings (like Manet, Van Gogh, ...) in 16 and 256 colors PCX files;
All the images from the 91 Corel draw contest in CDR and DIB format;
some midi files.
The PCX and DIB files can be read with Dieter Fiebelkorn's Gem-View 3.xx .

Clipart Warehouse

Compton's New Media M.O.S.T. CD-Roms :
Doctor's Book of Home Remedies
KGB-CIA World Fact Book
The Pill Book
The King James Bible
U.S. Presidents

You can view all these M.O.S.T. CDs with Brian Grier Perkp's
program. (MOST.ZIP, the demo version is on ftp at
Atari.archive.umich.edu.

3 - Can I use Photo-CD on my Atari ?

Of course You can !
To have full use of the photo-cds, you'll need a multi-sessions drive and
driver and also a program that can handle PCD files.

CD-TOOLS :
The driver from Hard & Soft can read multi-sessions discs and have all
the needed stuff to handle the Photo-CDs.

ColorDisc PCD :
Commercial software from Color Concept, Im Alten Breidt 4, D-53797
Lohmar Breidt, Germany, Phone: (02246) 7132

This program allows you to manipulate the photos on your Photo-CDs, and
save them on hard-disc. It handles Portfolio CDs.
If my understanding is good, it works with metados and a special BOS
file (both included).
It also includes a CD-Audio player.

A demo version is available at ftp.tu-clausthal.de.
ColorDisc PCD works on TTs and Falcons and costs 99 DM.

Studio Photo :
Commercial software from Eurosoft.
This french program can manipulate Photo-CDs.

Gemview v3.xx :
Shareware from Dieter Fiebelkorn, Gr&#65533;ner Weg 29a, W4370 Marl-Brassert,
Germany, Email : fiebelko@bonny.informatik.uni-dortmund.de

Gemview is also capable of handling PhotoCD's. Only in two resolutions
(Base and Base/4 I think)

4 - Can I play Audio-CDs on my Atari ?

Of course You can !

The following programs are available :

CD-TOOLS :
The driver from Hard & Soft includes a player for CD-Audio discs. The
drive must understand SCSI2 insructions(Or CDAR504 or the Apple
CD150).

3780. Re: How do I turn off MIDI-thru

From: hgm@unity.ncsu.edu
Message-ID: <2vup01$a2v@taco.cc.ncsu.edu>
Source record: 31510

I need the video scan rates and output type for the various Atari ST systems.
I know that the Falcon is VGA compatable (31.5, Analog RGB), but I am unsure
of the other systems.

I am putting together a listing of scan rates and output types for most of the
computer and video gear out there, in hopes that it will help people figure
out what can hook to what. As of right now, I only have listed the Falcon,
because that is the only one that I know about for sure (I don't know what
other scan rates it supports, though).

Isn't the ST mono monitor a TTL monitor, and the color an analog RGB with
a 15.75 scan rate?

Results will be available via Mosaic.....any help will be really appreciated.

If it is any help the mono-signal can be used as input to a multisync
(but then it must be on both the R, G and B lines), works OK...

The VBL frequency is 50 or 60 Hz for color and 71 Hz for monochrome

The original STs had two basic modes, 15.75 khz analog RGB, and 35 khz
monochrome. The Falcon supports these modes in addition to 31.5 khz analog
RGB (VGA compatible). I think the TT color modes are also 31.5khz analog
RGB, and I don't remember the hi-rez monochrome figures. It's definitely
ECL (differential pair) monochrome, somewhere around 80 khz scan rate.

>The problem is all about turning off MIDI-thru, but thanks anyway!

There is no automatic copying of MIDI-in to MIDI-out. The ST's MIDI-out
port is non-standard though, and has a -thru lead in addition to the
-out lead. If you have the wrong kind of MIDI cable, it may be merging
your ST's thru lead with the out lead, giving you this problem. I don't
remember the pinout off the top of my head, but you should be able to
make or purchase a MIDI cable that will work correctly with the ST...

I have tried to get this info myself for a long time, but I have no
easy way to read the DCD or set the DTR on Falcon. And people using
my comm-programs needs new program versions to use on Falcon.

ISn't there a simple solution (as on the ST and STE) for reading the
DCD and setting the DTR ??

And please, no referances to articles, documents etc... I have them
all, but still can't figure out this (and I have no Falcon to test on)

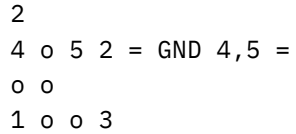
Howard may indeed be right about the cable: one not specifically made for MIDI
could be merging the out and thru - not a good idea! The ST has kludged the
MIDI out to include MIDI thru as well; this could be the root of the problem.
The usual pin-out for MIDI out is:



Atari additionally put a thru signal on 1,3. You could make up an adaptor to
split the ATari "out" into proper MIDI out and thru sockets.

I also have some code (tucked away somewhere at home) which copies MIDI in to
MIDI out, i.e. implements a rudimentary thru. If you're interested, I'll see if
I can dig it out.

Cheers,

3790. Strange bugs on ST with HD

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-13 08:21:35 UTC
From: oldcornd@cs.man.ac.uk
Message-ID: <30086f$frr@m1.cs.man.ac.uk>
Source record: 31435
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've been battling with this one for a couple of weeks now... but can anybody explain why ST's with TOS 1.2, 1.4, 1.6 or 2 should lock up completely inside certain read() calls (GEMDOS function $3f)? The same routine is used in a couple of different places, and works at one part but not at all at the other. If the same program is run from floppy, or on any other version of TOS, everything is OK. If you have a non-Atari HDI driver then instead of locking it can bomb instead.

Could anyone also explain why a program that works fine on 2M STe's won't work on some 4M STe's despite not making any different use of memory?

Dave

If my cables where merging the OUT and THRU -pins I wouldn't be able to turn the MIDI-thru behaviour off on the MIDI-out pin with Cubase or any other software, and that I can. Plus, I've checked the cables.

So, there must be some software in my ST that is echoing MIDI-in to MIDI-out. It may be a bizarre virus but I get the feeling that some programmer freaked after to many cups of coffee when creating the BIOS I've got.

3794. Upgrading an STe to 2.5Mb?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-13 13:25:37 UTC
From: ip@nessie.mcc.ac.uk
Message-ID: <1994Jul13.132537.2957@nessie.mcc.ac.uk>
Source record: 31439

My battered and ancient STe has had it's 4Mb of 60ns SIMMs removed to add to my Linux box. I still have the 4*256K SIMMs (which work fine) and recently, uh, liberated 2*1Mb 80ns (surplus from a Sun). I've tried replacing two of the 256K SIMMs in the STe to take it to 2.5Mb, but can't get it to work. The beast gets to the stage of loading the HD boot program, then stripes the screen and hangs.

I've replaced both the "first" and "last" two 256K SIMMs with the 1Mb SIMMS; no luck. After giving up it occured to me that I might have to replace alternate SIMMs, but it's obviously possible that either the 1Mb's are bad, or there's a speed mismatch.

Could anybody help? Do I need to speed-match all 4 SIMMs? I have no idea what speed the original 256K's are.

Thanks in advance,

Ian.

3796. 16mHz booting

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-13 18:11:50 UTC
From: boyd@hardy.math.fsu.edu
Message-ID: <301ap6$pbd@mailer.fsu.edu>
Source record: 31527

(forgot to cross-post this from c.s.a.st, sorry for the duplication).

I have grown to really like playing games in 16mHz mode on my MegaSTE. It really makes some games MUCH better than they are in 8mHz. I have a question about booting in 16mHz mode.

There are a few programs that allow you to do this with games that have an executable boot sector. The one I use is called booter, and I have a disk with this program in its auto folder that I use to boot games that fit the bill (it runs, asks you to switch disks, and you press a key). This program is on atari.archive.umich.edu in /Ste/Mega, BTW.

However, I have some games that do not have executable boot sectors, but instead run from the auto folder. I hesitate to add a 16mHz switcher program to the auto folder, as it might mess up the copy protection on the disk. By the same token, I hesitate to write an executable boot sector to such a disk (like a "virus free" boot sector) for the same reason.

It occurs to me that the perfect solution would be an executable boot sector that switches the machine into 16mHz, then waits for a keypress. The user would switch disks at that point, and when the key is pressed the boot continues. Even better would be to have the program check for another executable boot sector, run it if it exists, else continue the normal boot (which will go to the auto folder, etc.). This would provide MegaSTE users with one disk that can boot any floppy in 16mHz mode.

My problem: I don't know beans about writing executable boot sectors :-). Can someone tell me if this is feasible? Someone want to do it?

I think there is a problem with any proposal to drop ST from the
newsgroups. The main computers discussed in them is the ST and its
descendants the Mega, STe, TT, and Falcon. They are not meant, in my
understanding, to be forums for Atari 8-bit (or 6502 if you prefer)
computing, which is what they could become under such a reorganization.
Doing this, therefore, would be similar to calling the Amiga newsgroup
Commodore (or whoever ends up with it) or the Mac newsgroup Apple.

My (admittedly a bit old now) ICD manual says that your boot partition must be GEM. The size of what is a GEM partition and what is a BGM partition varies according to TOS version of course. Max 16mb for TOS 1.2 and less, and max 32mb for TOS 1.4 and above.

Saying that I can now boot off my D: BGM partition if I hit the D key on bootup before the ICD driver starts, a 6.x.x feature AIUI. :-)

3800. GFA memory management

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-13 22:38:39 UTC
From: hutch@ilmen.lanl.gov
Message-ID: <9407132154.AA02399@ilmen.lanl.gov>
Source record: 31530

I had a GFA user call me last night with a question I need some help answering. He is writing a bulletin board system in GFA and is having some difficulty with memory management (what else is new, eh?).

He is using GEMDOS calls (72, 73 and 75, I think) to reserve blocks of memory for his program and that part seems to work OK. But he reports that he has been unable to release all reserved memory once he is done with it.

In my GFA work I've never had to be concerned with this other than the occasional use of the simplistic RESERVE n statement. If someone here has more experience with these GEMDOS calls (or even MALLOC) that I could pass on to him, I'm sure he would appreciate it. He does not have any net or GEnie access so I need to reply to him by phone or mail.

Any help would be appreciated as would email replies.

Thanks,

-Hutch- @ Fair Dinkum Tech

You never mentioned what kind of software you're running. Cubase sets
their MIDI drivers to copy In to Out, and yes, you can turn it off. But
that's a feature of the Cubase program, not anything in the Atari BIOS
or XBIOS or anywhere else in the Atari ROMs.

The only reason for you to see MIDI in data being copied to MIDI out is
if some package you installed is doing the copying itself. The obvious
solution is to remove that software. I would suspect some kind of AUTO
folder program or desk accessory which you explicitly installed for this
feature, although I'm surprised that it doesn't interfere with Cubase.

Unfortunately, when I was doing the same thing, I was told by Aaron, the author of Freeze Dried Term, while at a local programmers meeting, that it is IMPOSSIBLE to fix the GFA memory management problems and therefore, a BBS written in GFA will crash after a maximum of 5 days without a reboot. Why? Poor coding by GFA themselves. GFA<>BBS.

I guess you are asking for a GDOS-driver wich supports color-printing
with 180 or 360 DPI. Sorry - did never see such a driver.
But if monochrome is ok for you, try drivers for Epson LQ, Star NB15
or NEC P6.

I'll add this too.

> c) The pinouts of the MC68000 so I can work out how to wire these into
> the ST.

No, you don't need this, since the memory is all hung onto the MMU.

> d) What these simms will fit (and worth so I can sell them 4 simms in
> total) so I can then buy the 16x 1M chips I could then solder into my
> Mega.

Well, there are only the up-market motherboards that carry 72pin SIMM
sockets (a la IBM etc.)

It depends which Mega you have - the Mega 2 was fitted with (AFAIR) 16
1Mb*1 chips and had pads for the other 2Mb. The Mega 1 was fitted with 8
256Kb*4 chips and as such you couldn't upgrade this so easily. What you
need for this machine is 8 1Mb*4 chips (514400 or equiv). You then only
have to remove the existing 8 memories in the machine, stick the new
ones in there and connect the A9 line on them to MAD9 on the MMU via a
68 ohm resistor.

However, these chips are expensive and generally cost more than a complete SIMM. The easier way is to buy the 1Mb*36 (as it is setup for the PC) and this can be wired as 2 banks of 2Mb*16 (4Mb total). This SIMM is made up with the 514400 chips and uses 4 of the 1Mb*1 (511000) for the parity bits.

Simple upgrade then is to remove the onboard RAM (by tying CAS or RAS high via a resistor) and then wire in the new SIMM with a short length of ribbon cable. If you're experienced with a hot-air iron, you could remove the 4 parity chips off the back of the SIMM and stick the thing under the disk drive space with a double sided sticky pad.

OK, the 72pin SIMM pinouts (as you'll need them for a full 4Mb upgrade with one SIMM) :-

BANK0 BANK1 Description
2 3 D0
4 5 D1
6 7 D2
8 9 D3
20 21 D4
22 23 D5
24 25 D6 Note: Data lines are paralleled across banks
26 27 D7 0 and 1
49 50 D8
51 52 D9
53 54 D10
55 56 D11
57 58 D13

65 64 D15

12 A0
13 A1
14 A2
15 A3
16 A4 (These lines all go to the MADx lines on the MMU with a 68
17 A5 ohm resistor in series with them)
18 A6
28 A7
31 A8
32 A9

44 RAS0
34 RAS1
40 CAS1L
43 CAS0H
41 CAS1L
42 CAS1H

1 Gnd
30 Vcc

47 /W (this is active low, shown with a bar above normally)
72 /OE (also active low) All OE pin's on the Atari's I have seen
are permanently grounded, as are the chips on the SIMM's)

Tip: You will need a good grounding lead as there is quite a bit of
current drawn by RAM chips and I suggest you wire a fat piece of cable
from OE to the ground track around the edge of the motherboard.

256Kb*4 RAM Chips

1 DQ1 Vss 20
2 DQ2 DQ4 19
3 /W DQ3 18
4 /RAS /CAS 17
5 NC /OE 16
6 A0 A8 15
7 A1 A7 14
8 A2 A6 13
9 A3 A5 12
10 Vcc A4 11

The 1Mb*4 RAM pinouts are identical to the 256Kb*4 except that pin 5 is
A9 (it's NC on the smaller ram).

It _should_ be possible to decode additional address blocks to put extra
banks of 256Kb*4 chips into the memory map but it's NOT an easy task. I
am currently doing just this and when I crack the problems, I will post
the details (if anyones's interested).

Hope that helps you out.

Cheers, Martin.

> of a network-like connection between Falcon and PC?

MiNT + MiNTnet + nfs on the Falcon.
Linux or PC-NFS (Linux is free, AFAIK PC-NFS is too) on the PC.

Connect them via the serial ports (you'll need a "null-modem" adapter
thingy, or a "null-modem" cable), run SLIP on both, and NFS on both.
This will allow you to mount the disk of one machine on the other.

Eventually, MiNT will have real support for SCSI devices, which will
allow you to buy a cheap Ethernet card for your PC, and a SCSI Ethernet
device for your Falcon; then you can use normal TCP/IP (MiNTnet will
support that before we've got real SCSI on MiNT) for NFS instead of
SLIP... it'll be much faster.

> Get the Minix distribution kit for "ease" of installation.

PLEASE people, Linux is being ported to the TT and Falcon ONLY; it
requires the studly memory management unit that first appeared in the
68020. As far as I know, no ST has an '020 in it, though some
accelarated ones might have an '030.

CURRENTLY, AFAIK, Linux runs (somewhat) on the TT; dunno if the Falcon
port is progressing. Last I heard, they were working on device drivers
(which would be a big stumbling block for '030-accelarated ST's...
they'd need different device drivers for almost everything).

IMHO, it might be easier to port the Amiga version of NETBSD; it already
works on the 68k platform.

Could someone who loves to hack into the bowels of the Atari come up
with a hack that allows the AES to use any GDOS font (including fonts
which are not 8 pixels wide) for all dialog boxes, menus, etc?

This would allow 80-columns in ST-Low by using a 4-pixel-wide font.

What an amazing and useful hack it would be! People would sing your
praises for many years to come. And you would be able to run GEM NetHack!

Message-ID: <302s5d$877@percy.cs.bham.ac.uk>
Source record: 31539

What's the best way to debug programs on a TT with a graphics card?
Most debuggers I've seen write directly to the screen, which is bad
news if your screen is a non-standard res (eg 24-bit True Colour) and
doesn't support Logbase and Physbase (ie most video cards :-).

Is it possible to run a debugger on the built-in TT video to debug GEM
programs running on the graphics card?

Thanks in advance!

It is possible:
1. You need a second monitor connected to the normal monitor interface
2. You need Peacebug (e.g. ftp.uni-kl.de, /pub/atari/programming/pbug1_21.zip)
3. You have to configure it to the resolution the second monitor uses at the moment the debugger is started

We tested this on a TT with ET4000 gfx board, if u have problems just send me a mail.

A few weeks ago, a number of TOS 2.05 users were asking about upgrading. In the UK, Atari no longer produce TOS 2.06 themselves for resale. Instead, Compo have been given the rights to sell copies. If you already own the EPROMs (like all 2.05 owners I know of) they will copy 2.06 onto them for
19, including return postage and VAT. There is probably a distributor like this in other countries, and they are the only people allowed to distribute the docs as well as the chips.

In order to pass MIDI-in data to the MIDI-out pins on the MIDI-out
jack, some piece of software (OTHER THAN TOS!) has to be echoing
the data (by the way, retransmitting MIDI-in data to the MIDI-out
jack is technically called 'MIDI echo'). Have you tried booting
from a clean system (no AUTO programs or ACCs) to see if it still
does this?

Somebody from Germany posted some information on this a few months ago.
It appears that the STE can run @ 12 Mhz, (I presume they change the the 32 Mhz Master Oscillator to a 48 Mhz one).

You have to have a multisync because of the new video rates!!

I've been half following this thread. I thought that MIDI thru was echoed
to MIDI Out as a hardwired thing. It certainly used to be like this on old
machines AFAIK and I've never read of this being changed. Hence theneed for
proper MIDI cables as just buying a DIN cable would cause problems due to
the STs non-standard handling of the pins in this respect.
Have I missed the point of the discussion?

Hi all...

First, I have a problem. I have mint more or less installed the way the Distribution kit sets it up. One difference. Initially, I let the DK do it. I've since put a new hard drive online. I made a new partition ready using SETUP.PRG and then copyed the tree from the "old" minix partiton to the new one. Everything seems fine, the system runs good. Until I try to man something. I have the environmental variable TMACDIR pointing right where tmac.an is. It keeps saying "can't open c:\lib\tmac\tmac.an". Well, shouldn't it be looking where TMACDIR says to? Also, I put tmac.an into a /lib/tmac dir on C: and it gave me the same error...anyone have a clue?

Second, now that I'm happy with the distribution kit, how do I upgrade Mint and minixfs? I've seen lots of thingers on a.a.u.e, but don't know where to start. also, what's the deal with "patchlevel"? (ie what does that mean?)

Thanks in advance,
Matt Koundakjian <mattk@netcom.com>

3818. Teac floppy setings

Howdy.

I ahve a Teac FD-235HF drive I'd like to use in my STF. (Of course, I should ask if it is in fact a HD drive--I'm pretty sure). What are the proper jumper settings to use it as drive A inside my ST? I'm planning on putting in the little circuit that switches 8mhz-16mhz feeds depending on the media...any caveats?

Bye for now,
Matt Koundakjian <mattk@netcom.com>

Funny you mention that. I have a Quantum LPS540S I bought from them
installed right now....I broke it up into 3 100mb partitions, 4 16mb, and
1 75mb partition (which I'm using for minix)

>Only very old disk utilities (Cheetah comes to mine, but it has other
>horrible bugs as well). You probably don't have to worry about it if you
>have kept your utility software fairly current.

I've got cheetah 3.0, which seems to work fine with the BGM partitions.
The old version I had would make FAT entries that a system fixer like
Edge might choke on. 3.0 hasn't done anything wierd yet.

>> Second problem would be if you wanted a 250mb
>> partition, you'd have 8k logical sectors. This would be wasteful when it
>> cones to small files, right?

>They are more wasteful than 512 byte sectors. Such is life :-). I don't
>think it will be a major problem (or even noticable). You would probably be
>better off making a few smaller (but still large) partitions. Of course,
>your boot partition must be non-BGM.

another user here said that 8k sectors are used normally, that is, a 1k
file doesn't eat an entire 8k sector...

>> I guess I'd like to know if anyone is using BGM partitions on a daily
>> basis. The Minix filesystem driver seems to not mind BGM partitions,

>myself, but I have been using BGM partitions for a couple of years now with
>no problems. Anything made in the last 4 years or so (that is a guestimate,
>I'm not sure when BGMs came out but it should be around there) won't have a
>problem with them. Only programs that work with the disk at very low
>levels are eligible for suspicion.

I'm usually pretty suspicious of lowlevel things anyway. At a low level,
there's too much opportunity for "illegal" calls that may not pop up
until months later and there goes your files....it's happened to me, with
the old ver of Cheetah...wonder if he's put out a new version?

Bye for now,

I'm afraid you have, Iain (either that or I've missed it!). The original
poster said that anything going to his MIDI in was coming out of the
MIDI out. Therefore, either
a) Some software is doing this echo (eg Cubase can do it).
b) He has funny cables that is swapping signals, such that the
MIDI thru signal (that Atari added in, in defiance of the
MIDI spec) appears on the OUT pin.

Either scenario is easy to check. For (a), buoot with a clean system.
For (b), use a genuine MIDI cable, which does NOT connect the pin that
Atari use for the thru.

Xdebug gives assembly-level and half-hearted-source-level debugging,
provided you can sort out the screen display.

I must try it on the Falcon sometime...
Lattice' MON030 works OK on the Falcon (don't know about TT graphics cards
though).

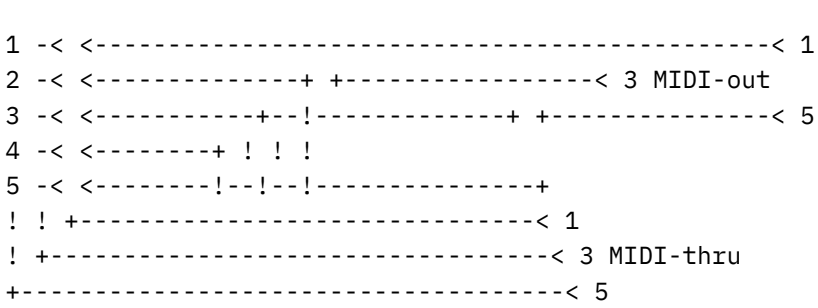
The ST has hardware MIDI-thru on the two pins of the DIN socket for MIDI-out which aren't normally used (i.e., pins 2 and 4). You can buy or make an adaptor cable to give you a MIDI-thru, something like:



Or something like that. :)

Disclaimer: what I just drew may very well "let the smoke out" of you're ST. Check it before you try to do it. Or buy a "ST MIDI thru" cable. And then tell me where you found it...

Was it coming out on the MIDI out pins or the MIDI thru pins? If it is the MIDI thru pins then this is normal behaviour, yes?

Maybe I should keep quiet before I confuse everyone..

If I remember the part number correctly, I believe that I have the same drive working with my ST (it is HD). I did not have to change any drive jumpers from the factory settings. I use a manual switch to go between 8MHz and 16MHz on the floppy controller, since I am using the Teac as an external drive while still keeping the original 720k drive in my ST. This setup works great for me with no problems. It should be easy to replace the manual switch with the floppy HD detect signal. Let me know if you have amy questions. Note that you may want to put a heat sink on your floppy controller chip. Mine seemed to do funny things after running at 16MHz for a while. After a put a little heat sink on there, there were no more problems.

Does any one read the Doc's that comes with ICD Utils, it does state a small boot partition is better, in fact the default set up is for a 5 meg partition, this is because the boot partition seems to be the one that gets stuffed on Atari, and it then makes it easy to back up a 5 meg partition, but then again ICD does not know what its taking about, every one else knows better....

3829. Parking a 30MB Supra Drive

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-15 01:40:59 UTC
From: sammcgee@crl.com
Message-ID: <304pfb$k4l@crl5.crl.com>
Source record: 31354

I bypassed the interface on my 30MB Supra Drive and I now control it directly through the Falcon SCSI port instead of the Atari DMA cable. The problem is that I can't park the heads using the Supra park program. I tried other PD park programs and none of them work.

Also, any suggestions on a good replacement mechanism, somewhere in the 300MB range? What specs. do I need - mounting dimensions, size, height, power requirements? Can I just buy any 3.5 inch half height SCSI drive and throw it in the Supra case?

Sam

3830. Storm's BASIC to make UNIX shell

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-15 01:42:48 UTC
From: sammcgee@crl.com
Message-ID: <304pio$k5g@crl5.crl.com>
Source record: 31355

I'm trying to program a shell program using Storm BASIC for file utilities through UNIX. (delete, rename, download, etc.) I tried reading the file names into an array:

```
SEND "ls -1" ' List file names one on each line.
TERM OFF ' The BASIC doc's say to use this???
i=0 ' Clear the array counter.
WHILE i=0 or n$<>"" ' Repeat loop until no files left.
COMINPUT n$ ' This reads a line from the com port.
i = i + 1 ' Increase the array counter.
files$(i)=n$ ' Load the array.
WEND
```

This doesn't work. Sometimes COMINPUT reads one line, sometimes several. Basically, I don't know how COMINPUT works. Please help, thanks.

Sam

ps If there is a shell that already does file utilities like pine or elm do to text editing, let me know.

>provided you can sort out the screen display.

The criticism I've heard of Xdebug is that it doesn't support typedefs
or structs, which is actually because the Lattice debug format doesn't
support them. I recall the original Zortech debugger (not made by
Zortech!) had to 'compile' the source files itself to figure out the
struct and typedef info.

>I must try it on the Falcon sometime...

3835. T28 / PAK3 Summary :-)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-15 11:11:08 UTC
From: e2daka5@etek.chalmers.se
Message-ID: <1994Jul15.111108.5605@etek.chalmers.se>
Source record: 31362

(New try, since I forgot the Subject-line the last time)

Hi everybody! Sorry for being off the net for a while, but I've been collecting as much info as possible during a few days...

I finally got my hands on two issues of the German magazine "ST Computer" that tested acceleratorcards, including HBS 640 and PAK3.

I also want to thank two Germans who have been informing me on the subject.

Hi Till! Hi Karlheinz! :-)

OK, here is what I've come up with:

Harware info (short):

PAK3 is an accelerator card that substitutes any(!) 68000 with a 68030 and an optional 68881/2. To run a PAK3 on an Atari, you will need at least TOS 2.06, but the better choice is a (patched) TOS 3.06. The PAK3 has a 32kB cache.

HBS 640 T28 and T36 are accelerator cards that speed up a 68000 to 28 or 36 MHz. An interesting thing with this card is the Fast-ROM (switchable) 16MHz access to the ROMs/EPROMs. 64kB cache is implemented. TOS 2.06 recommended.

Experiences, tests etc:

The MegaSTE seems to have some problems with the HBS 640 T28 and HBS 640 T36, especially with the 36MHz card. Any ST seems to have some problems to handle signals of > 32MHz (approx.). The safest, fastest, and most expensive (depending on how much you have to pay for the CPU/FPU) card seems to be the PAK3 (full name PAK 68/3-030) sold by the following companies:

All nubers are in % rel. an 8MHz ST

Summary:

You get what you pay for! The T28 works fine on an STfm (according to "ST Computer") and costs approx. half as much as the MUCH quicker PAK3.

Hope this helps :-) !

: >
: >So, there must be some software in my ST that is echoing MIDI-in to MIDI-
: >out. It may be a bizarre virus but I get the feeling that some programmer
: >freaked after to many cups of coffee when creating the BIOS I've got.

: You never mentioned what kind of software you're running. Cubase sets
: their MIDI drivers to copy In to Out, and yes, you can turn it off. But
: that's a feature of the Cubase program, not anything in the Atari BIOS
: or XBIOS or anywhere else in the Atari ROMs.

I said that I can TURN OFF the MIDI-echo by running Cubase.
If I don't run Cubase (or any other program), MIDI-echo is ON.

: The only reason for you to see MIDI in data being copied to MIDI out is
: if some package you installed is doing the copying itself. The obvious
: solution is to remove that software. I would suspect some kind of AUTO
: folder program or desk accessory which you explicitly installed for this
: feature, although I'm surprised that it doesn't interfere with Cubase.

The only auto-installed program in my ST is a program that turns off the
key-click and that one I made myself. Is .ACC files really executed
when I turn on my ST? I thought that they just where loaded into memory.
BTW: The Cubase developers most certainly made their own MIDI-in-interrupt-
routine when creating MROS.

Here's how it is:

* I bought a new Atari 2080ST with Swedish TOS (don't know which version) a
long time ago, which I have never opened, changed proms in, or altered the
original configuration in, in ANY way.

* I turn it on with no harddisk connected, no disc in the drive, no cartridge
in the cartridge-slot. It's not connected to anything but the monitor and
my MIDI-stuff.

* I send MIDI-data to the MIDI-in-port and I receive the same data from the
MIDI-out-port, pin 4 and pin 5.

* With some software (Cubase) I can turn off this MIDI-echoing.

Reading your responses to my question makes me come to the conclusion that,
a) something is wrong with the Swedish TOS I've got.
b) I've got a TOS that not many people know of.

The fact that my 2080 is one of the first 2080's around (doesn't even got a serial-number), makes me think that the reason for this behaviour is a combination between both a and b.

> Why? Poor coding by GFA themselves. GFA<>BBS.

This may be true when using the GFA-internal possibilities for
memory "management", i.e. RESERVE. RESERVE has its bugs. You can,
however, use Malloc() and Mfree() freely, which gives you the
same flexibility as in other languages.

Malloc() and Mfree(), however, have their own limitations, mainly
that a process should not call Malloc() too often. Instead, it
should Malloc() large chunks and manage the chunks itself
in a malloc library, just as it is done in C.

Having said that, I still wouldn't recommend anyone to write a BBS
(or any other large application) in GFABASIC - but not necessarily
because of the memory management.

From: John_Collis@equinox.gen.nz
Message-ID: <John_Collis.1rlt@equinox.gen.nz>
Source record: 31367

Hi there,

I'm trying to use a Seagate ST-157N with an ICD AdSCSI Micro Host Adaptor
and I'm having problems. The HOst-adpator does not want to talk to the
drive. Are there any known problems with this combination?

Also can anyone help/advise me on the jumpering of this drive? there are 5
set's of jumper pins. I assume that 3 of them are for SCSI ID, but what are
the other 2 for parity?? please I need help as I don't have any documetation
for the drive mechanism.

Thanks in advance!

How does one go about getting docs for Storm's BASIC? Is this a part of the registration, or can you d-l them from someplace? I'm still trying to decide between registering for Connect or Storm, and programming might just be the key.

Thanks in advance,
Tom Hopper

Don't know about Compo, but you might check with Codehead; last I checked
(couple of months ago) they handled upgrades and manuals for TOS 2.06.

The next issue of Processor Direct magazine will have an article detailing the majority of what you need to know about doing everything from setting a wide range of baud rates to handling the control signals. Since you're outside of the US, if you want a copy, you can order one directly from us (the money exchange won't be fun), or you can talk to your local dealer and get in contact with your local magazine distributor and get them to order some. The last issue was very nice too, so you may want them to order some of them too.

3842. TOS 4 and the order of .ACCs

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-15 17:31:39 UTC
From: molin@cxc1.cl.msu.edu
Message-ID: <306h5r$kl4@cxc1.cl.msu.edu>
Source record: 31369
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I had a problem with some accessories conflicting with System Audio Manager and, with the help of XBoot, was going throught the process of elimination to figure which was the culprit. In the process, I also concluded that there might be correlation with the order in which they are installed in the system. Using a directory sorter, I alter the order in which they were arranged on drive C: but found that it didn't have the expected effect in the order in which they appear under the DESK drop-down menu. Anyone know if there's any rhyme or reason to the way they appear? In TOS 1.4, the first ACC loaded was at the bottom of the list, the next was second from bottom, etc. In TOS 4.04, they are not in order at all.

Here's how they stack up for me:

On disk in this order:	In drop-down in this order:
WARP9 control panel	EdHak
STalker SAM Config	
MultiDesk Deluxe	MultiDesk
XControl WARP9 c.p.	
SAM Config	XControl
EdHak	STalker

Anybody have any clue why this is?

3845. For Sale: SupraDrive case

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-15 19:12:16 UTC
From: boyd@hardy.math.fsu.edu
Message-ID: <306n2g$1fq@mailer.fsu.edu>
Source record: 31371
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have the case from a SupraDrive 80mb for sale. It includes a shoebox style case (marked "SupraDrive Atari Hard Disk" on the front), power supply, fan, Supra host adaptor, and all cables and such. It is exactly as it was from the factory, except there is no hard drive contained within (it takes one standard 3.5" SCSI device). The mounting hardware for the drive is included (it had a Quantum 80S in it before). The case is grey enameled metal, with a green power and red activity LED on the front. I do not have a copy of the Supra host adaptor software, but I could probably dig one up if needed. I believe the ICD Pro utilities will work with this card, which would be a much better choice IMHO.

Toad computers sells a very similar case for $99 (without host adaptor!), which I think is a bit high. I'm asking $50. It is in like-new condition. Alternately, I would be very interested in some trading, as opposed to cash. I am in search of an external DSDD floppy drive (must format out to at least 83 tracks, which can be checked with DC MaxTracks on atari.archive.umich.edu), a MC68881 math coprocessor, Wico bat handle or Ergo joysticks, and numerous software thingies (particularly games).

Please email all replies.

> : In order to realise MIDI-though you'd either have to write a routine that copies
> : every byte from MIDI-in to MIDI-out or change the hardware to do so (I read that
> : it's quite easy, but I wouldn't do it!).

According to the sources that I have, Atari routed the MIDI-Thru onto the MIDI
out port in a non-standard way so that they could save a connector. Normally
the MIDI current loop is carried on pins 4 and 5 of the 5 pin DIN plug, Atari
has put the MIDI-Thru onto pins 1 and 3 (normally unused) of the MIDI-Out port.
A simple y-cable could be made up which plugs into the ST's MIDI-Out and
produces a proper MIDI-Out and MIDI-Thru port using pins 4 and 5 on both.

There was some discussion about whether BGM partitions can be booted.
Some said the ICD manual was affirmative about it and some said no. I
looked my ICD manual, copyright 1990, and it said Tos can't boot from a
BGM. Are those who use BGMs as boot partitions running a higher Tos version?

Bye for now,

> a BGM.

AFAIK the TOS startup code doesn't care about the logical sectorsize of
any partition. The TOS startup code reads and checks the rootsector of
any harddisk it detects, and executes the programcode contained in that
rootsector. This rootsectorcode is responsible for loading the harddisk
driver software. Off course it is possible that the ICD bootloader was
not able to load the driver from a BGM partition.

Does anyone have an e-mail address for the author of Digital Audio
Multilayering editing program?
I am interested in finding out what is available for the Falcon.
The Shareware version is constantly bombimg but looks like a very powerful
program if he has worked out the bugs.
Any and all help would be appreciated.

Thanks

Message-ID: <774392532snz@midmarsh.demon.co.uk>
Source record: 31402

Has anyone else had problems with the expire facility in NOS?

Twice recently this has reported a disk fault and zeroed a whole newsgroup for me. When this happens, trying to access this newsgroup from the Usenet menu causes problems and leaves locked files around. The only way out that I've found is to delete the newsgroup and add it in again.

I've checked the drive with Diamond Edge and found no problems as yet.

Also I seem to have problems with the 'add a newsgroup' facility: It appears to create everything OK and always adds the correct line to NNTP.DAT but the newsgroup doesn't show in the list. A second attempt adds second copy to NNTP.DAT but it now shows. Then I delete the extra line from NNTP.DAT and all is OK.

Both these problems are intermittent.

>and I'm having problems. The Host-adpator does not want to talk to the
>drive. Are there any known problems with this combination?

Thanks to those who helped so far. I now have the jumpering questions
sorted.

I now think that the AdSCSI Micro is not getting power. Can anyone
advise me how I could check this out?? (For those who don't know, it
sits on the SCSI connector of an embedded drive and gets powered from
the drive through the bus.) What pins in the SCSI bus carry power, and
what voltage?? Are there any other solder pads on the ICD unit where I
could connect a 5v or 12v power supply to??

If neccessary I could make up a short 50-way SCSI connector with
external power supplied, if I know which lines to connect it to but
obviously I need to know which ones first! :-(

Any help would be much appreciated.

Cheers,
John

From: magic@mtu.edu
Message-ID: <309t88$6t@maxwell1.ee>
Source record: 31384

Howdy,

I am currently attempting to write a disk formatter/copier to work
within a database program (so that back-ups can be made without having to
exit the program) Currently my problem is formatting the disk, I have
the routs coded for a sector copy, but I am having trouble formatting
an exact copy (i.e. reading parameters and then formatting to those parameters)
I am using xbios 10 according to the parameters found in the atari compendium,
but unfortunately the xbios call is returning a -1 (general error) when it
attempts to format a track. The drive light never comes on, but I can hear
the drive stepping from track to track... Any ideas/info would be appreciated

Thanx,

-Magic

You can set the Quantum ELS drives' parity in software but to do this is
complex (think it was "mode select" command, byte 4 bit three etc) the
easy solution is to get ICD Pro utils, this has a "fix" program for the
Quantum drives and also the Seagate ones AFAIR.

Cheers, Martin.

Sam McGee (sammcgee@crl.com) wrote:
: I bypassed the interface on my 30MB Supra Drive and I now control it
: directly through the Falcon SCSI port instead of the Atari DMA cable.
: The problem is that I can't park the heads using the Supra park program.
: I tried other PD park programs and none of them work.

The ICD Hard disk parking utilities don't work either. I used to like to spin down and park my Syquest drives before powering off, and it's not an option with the Falcon.

The odd thing is that Atari describes two ways to park the hard disk in the Falcon manuals, and neither of them are available. SHIP.PRG is not provided, but appendix B of the manual says it is. HDX is supposed to have a menu selection called "Ship", but this has been removed from the Falcon version. I downloaded an older version of HDX, and it had the selection -- it just didn't do anything.

The conspiracy-minded might suspect that Atari discovered that the Falcon didn't park drive heads, and it was easier to doctor the software than to fix the problem!

It's funny you should bring this up as it does the exact same thing
on my system. For some reason, STalker and Xcontrol seem to want
specific desk accessory slots (though not on the disk that way, they
show up with Xcontrol on the second to last slot and STalker on the
last slot on my system too).

> Or get a ICD Link II and use it in a external Box....

Another problem may arise with the "unit attention condition" most scsi drives report after power-up. The TOSROM routine reading the root sector is unable to handle this, hence you can't boot from the drive. I remember a special boot sector for floppies which clears the condition, enabling the TOS boot process to succeed.

Another way is to reprogram the drive and tell it not to produce unit attn. It's somewhere on the mode sense/select pages (page 0?).

I had a Hypercache in my MEGE ST4 when I had one. Worked great.
It's a 16 Mhz 68000 with 8K cache-RAM (HyperCache 16 then has 16K).
Really speeds up things (when you buy an accelrator card with a 16
Mhz processor you MUST have cache-RAM, othervise no speed improvment)

One of the Codeheads discussed this on the topic of using CodeKeys on GEnie. The user wanted to know what order the desk acc's would be displayed in the DESK menu. I am not really a programmer but as I remember it he said the order could NOT be predicted. The acc's would load in order as they were on the disk (no sort) but they would appear in the menu according to which one executed some command (forgotten, sorry) first. This initialization command could be anywhere in the program and acc's that have it near the beginning would show up more towards the top of the menu.

The Codehead was of course more eloquent and technically accurate but that was the gist of his post. If I find it I'll repost.

I welcome any and all rebuttals, please.

From: jchappel@charon.engga.uwo.ca
Message-ID: <gZimPc1w165w@charon.engga.uwo.ca>
Source record: 31396

Thanks to those who helped me find the correct addresses, etc., I have gotten part of my Atari Touch Tablet interface to work. In fact, it works great with a joystick and it works great with the paddles. And of course, the touch tablet is supposed to work like an X-dir-paddle, and a Y-dir-paddle, with the buttons working as joystick buttons. But for some reason, it just won't return the paddle values.

Like I mentioned, regular paddles return values just fine, but the Touch Tablet will not return any but one value (which changes each time I try it).

Any ideas? I've come to the end of my rope here...

Thanks. -Jerry-

Hmm if it's a 30Mb drive, that can't be a ST-157N as they are rated as
48Mb formatted, 57Mb unformatted.

I used to have a similar problem. In my case the computer would
often lock up completely when I tried to do what you describe.
I had to do all file copying, between floppy and hard drive, one
file at a time.

After a while I realized that TCACHE was causing all the problems
(yes, I was using the latest version). Since I removed it, every-
thing has been working perfectly.

My theory is that TCACHE changes the DMA direction from HD->RAM
to RAM->floppy (or the other way around) too early, but I might
of course be wrong. It was TCACHE's fault, though.

If the author of TCACHE is around, I'd like to hear what he has
to say about it.

>I've been told that many Falcons have the same problem. Where
>does it come from?

Perhaps many are using TCACHE? It sure was a nice program!

There's only one line that carries power: the termpwr-line powers the
terminal resistors on the last SCSI unit. It is driven by the computer
or host adaptor but usually not by the hard drive.
The 'last' pin of most ic's is connected to 5V (e.g. pin 20 of an 74LS245 or 373).
You may connect one of these chips to 5V.

I don't use TCACHE. I've even tried with NO auto program/accessory (by pressing CTRL while booting). And I've got 2 bombs.

But with Kobold 2, there is no problem.

Does anyone else have the same problem ?

I have heard this problem is caused by how the floppy is formatted. MSDOS preformatted disks can cause this - try using an Atari format.

As Lars so kindly said, it's a 16Mhz 68000 Cpu with Fast-cache, (although
my card has 32Kb cache).

Try call AtariWorkShop in the Uk, i know they have been selling it, though
i'm not sure if it's available any longer.

3887. Order of ACCs in drop dwn menu

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-18 17:38:49 UTC
From: sammcgee@crl.com
Message-ID: <30een9$2nn@crl5.crl.com>
Source record: 31410

Here are two messages found on GEnie regarding accessory order:
Sam
sammcgee@crl.com

Category 32, Topic 22
Message 5 Fri Jan 28, 1994
J.EIDSVOOG1 [CodeHead] at 09:21 EST

Sorry, guys. Lots of incorrect info here.

There is no way to exactly predict the order of the ACCs in the menu. GEM loads them from disk in a no-sort order and then begins executing them through the event system. But there's no way to predict how many AES calls an ACC makes before it makes its menu_register call, and that's what determines when GEM stuffs their menu names into the drop-down.

If you copy ACCs in a no-sort order, they will install in the same order as they did on the source, but you can't predetermine this order to suit your needs.

MultiDesk loads its resident ACCs in the order that you tell it. It has nothing to do with the alphabet.

Our Auto Organizer program only sorts AUTO programs, not ACCs.

I do appreciate everyone's attempts to help, though. <grin>

John

Category 32, Topic 22
Message 13 Sat Jan 29, 1994
J.EIDSVOOG1 [CodeHead] at 18:49 EST

Here's an example showing why you can't predict the order of ACCs in the drop down menu. Let's say you have three ACCs, named APPLES.ACC, ORANGES.ACC, and PEARS.ACC. Let's also assume that they have been copied to your boot drive in that order (alphabetically) so that their unsorted order is alphabetical.

When GEM initializes, it will first load all ACCs in the (unsorted) order it finds them and then begin by jumping into the first one. Each ACC will execute until it makes an AES call and then GEM will pass the ball to the next ACC in a round-robin order. GEM's own desktop code will be one of the applications cycling through this coffee klatch, but for simplicity's sake, I'll leave it out.

The following table illustrates the order of execution of the ACCs routines. You can follow it by reading across, one line at a time. I've selected a purely hypothetical series of AES system calls to be made by each ACC:

```
APPLES.ACC ORANGES.ACC PEARS.ACC
---------- ---------- ---------
(loaded from disk) (loaded from disk) (loaded from disk)
appl_init() appl_init() appl_init()
rsrc_load() menu_register() appl_find()
rsrc_gaddr() evnt_mesag() menu_register()
rsrc_obfix() evnt_multi()
rsrc_obfix()
.
.
.
menu_register()
evnt_multi()
```

When GEM gets a menu_register call it puts the name of the ACC in the next available drop-down slot. Atari has never released any official rules as to the order of calls an ACC must make when it initializes (other than starting with appl_init), so none of the above scenarios are wrong but each one calls menu_register at a different point. Based on the order of execution of the AES calls in the above examples, the menu would look like this:

```
Oranges
Pears
Apples
```

The bottom line is that unless you know the exact order of the internal system calls made by every ACC you use, there's no way to predict for sure which order they will appear in the drop-down menu. Note that there might be other system calls (GEMDOS, VDI, etc.) in the above examples but I've only listed the AES calls since those are the calls which GEM uses to pass the order of execution between applications (in my understanding).

gnox,

You "tell" MultiDesk which order to load its resident ACCs by loading them in the order you want them (and then saving your setup).

Joe,

If you've found ACCs to load in "reverse non-sort" order, it's been by coincidence. <grin>

: > that he has been unable to release all reserved memory once he is done
: > with it.

Using the MALLOC() and MFREE() calls, I never had any problem
like the one you describe. These functions are available in
GFA 3.0 and later; they generate the corresponding GEMDOS calls
without adornment as far as I could find out.
The basic pattern to use these is:

```
adr%=MALLOC(length%)
IF adr%>0
'
' use allocated block
'
~MFREE(adr%)
ENDIF
```

This can be repeated arbitrarily often, but the nunber of allocated
block at any time is limited by GEMDOS.

: Unfortunately, when I was doing the same thing, I was told by Aaron, the
: author of Freeze Dried Term, while at a local programmers meeting, that it
: is IMPOSSIBLE to fix the GFA memory management problems and therefore, a
: BBS written in GFA will crash after a maximum of 5 days without a reboot.
: Why? Poor coding by GFA themselves. GFA<>BBS.

It is true that GFA's *internal* memory management is buggy, but that
does neither affect the functionality of the built-in GEMDOS interface,
nor does it interfere with the MALLOC() and MFREE() calls; they work
flawlessly.
It may be true that GFA's internal memory management bugs cannot be fixed
(at least I know of no way). However, it is still possible to write
programs that can run for arbitrarily long times, or at least substantially
longer than a week -- I've done it. Here are some guidelines I usually
try to follow in order to minimize the chances of being bitten by the
internal GFA bugs:

1. Don't use RESERVE, use the $m compiler directive instead. For testing the program in the interpreter, switch to direct mode and enter a RESERVE command manually before even loading your program into the interpreter if your program needs to allocate substantial amounts of memory. Do not call RESERVE without arguments; this fails with some newer TOS versions. Never call RESERVE after strings or arrays have been created.

2. Insert the line

~FRE(0)

frequently. It causes a garbage collection, and frequent calls prevent the internal memory from becoming seriously fragmented. This in turn seems to reduce chances for creeping up of internal bugs. I tend precede all RETURNs from functions or procedures with ~FRE(0).

3. Avoid unnecessary string operation and creating and erasing arrays (with DIM and ERASE). Follow ERASE statements and heavy string computations with ~FRE(0).

I have come to these rules by using common sense, not by checking the interpreter with a debugger or somesuch. All I can say is that adhering to them has eliminated some problems that seemed to be due to GFA's internal memory management bugs.

> [...]

It rather depends what he's trying to do. I've heard and found that it can be a bad idea to mess about too much with multiple malloc() (and especially GFA RESERVE). GEM wasn't really well written on that point and even with patches such as poolfix etc, the system is likely to run afoul of fragmentation of the free memory given enough allocation and reallocation. This is not specific to GFA, even though RESERVE has definite problems in this respect, especially as many never fully understand the usage given the skimpy documentation in the manual.

For a stable BBS, recommend to have well placed ~FRE(0) calls prior to setting up or redefining any new string variables. The best is probably to use predefined arrays or other fixed blocks of memory as much as possible to minimize such problems.

Another problem that GEMDOS appears to have is handling many open files simultaniously.

Otherwise the main problems I see turn out to be some careless turn or other of source code which eventually hangs the program.

I think HiSoft BASIC 2.1 is the only way to go with a Falcon. It's the best
BASIC I've ever used and I'm very happy with it. The price is steep but
you get what you pay for. (in this case anyway:)

I wrote little Falcon icon editing program with it. (46k of code) If you
want it to help you get familiar with windows/dialogs etc. let me know.

IL>I've been told that many Falcons have the same problem. Where
IL>does it come from?
IL>Vincent Lefevre
IL>email: vlefevre@ens.ens-lyon.fr

I bet your hard disk does a clicking sound and is VERY slow at times.

There is a lead that goes from the power supply to the motheboard right next to the hard disk. This lead (has several wires) passes right next to a component on the power supply (marked L2 i think, it is cylinder shape and has a wire that goes around it). If you take the wires and push them to the opposite side of the component the problem will be fixed.

After you done with the fix the best thing is to backup the boot partition, erase it and reinstall the driver.

Michael Papadopoulos.

Having remounted two ST's into tower cases, let me set you straight on a couple items. The main problem is finding a PC case that has room for the long ST motherboard. If you can find that, you're halfway there.

I use Teac 1.44 floppy drives....but only as 720K drives. There have been a couple of attempts at upgrading the ST to use 1.44, but i don't know if any have been successful. You don't use IDE drives...you just mount your host adapter card (I use ICD's) in the PC case and mount SCSI drives in there with it.

I invented a gadget called DEKA that lets you use PC keyboards with Atari's. It had been out of production until just this week. Another company has bought the design and it manufacturing them again. Call 516-473-2507 for info on it.

I am just now retiring my 1040 STe, which has been tower-mounted for three years, and replacing it with a Mega4, with ADSpeed, mounted in another tower case.

Yes, that's the impression I've had when I've read stuff about SCSI.
On the other hand, the ICD Host adaptor definitely expects to _get_
power from the disk drive via the SCSI bus. This is an AdSCSI Micro.
The Link and I assume the Link II do the same. Is this a bit of a
shortcoming??

Does anyone know whether the Seagate ST-157N is supposed to supply
voltage on the TERMPWR line of the SCSI bus?? I know the particular
one I am trying to get working, doesn't seem to be.

The article is about installing 12 Mbytes of memory into a [Mega] STe with the help of a board called Xtra-ram +8, and you need to have 4 megs to start with.

The article is from ST-format issue 57, I think thats march 1994

Are there any possible catches anyone knows of to watch out for when fitting a double-sided floppy drive from a 1040STF to an *old*-style 520STFM which previously had only a single-sided drive?

I assumed this would be completely simple, but tried it yesterday and the drive at first acted as single-sided, then eventually wasn't recognised at all.

Cheers,
Matt

PS - Where can I find a FAQ for this group (pref. in the UK)?

First of all, look at the email address of the poster. If it does NOT have a country designator (uk, de, au, etc) then you can bet the poster is sending from the USA.

Secondly, if it's a for sale ad, a good tip off is the currency in his/her asking price. Dollars, pounds, deutschemarks, yen, etc...

While I do not argue the fact that posting a country of origin in the ad or in the poster's signature would be a courtesy, I hardly think it a necessary requirement to do so in the subject line, IMHO.

And Ian, your tongue-in-cheek comment sounds like 'sour grapes' to me. :) The majority of postings on the Usenet come from users in the USA. It's only natural, then, for it to assume a certain US behavior norm. It's an understandable side-effect (although you don't have to like it). Besides, the international traffic in the Atari forums is significantly heavier than the other computer topics because of the preponderence of European Atari users. The apparent level of Atari support in the way of magazines, dealers, and products in Europe makes many US Atarians turn green. :)

What bothers ME about all these for-sale ads IS the fact that they are here. I'm not complaining about them being in the comp.sys topics, only that their preponderence indicates a further downward slide in the installed user base.

Ah, 'the times they are a changin.' <sigh>

Source record: 31291

I'm trying to use these two for editable text fields in a custom form_do() handler. I can't seem to get them to work at all. I'm using TOS 2.06. This is the abridged form of my code:

```
myform_do( tree, editobj )
OBJECT *tree;
WORD editobj;
{
WORD idx, events, key, clicks, newobj, etc... ;
static WORD msg[8];
/*
Supposed to turn on edit cursor in 1st field but it doesn't
*/
objc_edit( tree, editobj, 0, &idx, ED_INIT );
events = evnt_multi( etc. );
if ( events & MU_MESAG )
{
/*
This part works perfectly
*/
}
if ( events & MU_BUTTON )
{
objc_find( etc. );
if ( !form_button( tree, obj, clicks, &newobj ) )
{
return( newobj );
}
/*
This is how I'm handling editable field selections.
It works but not real well as text cursors get screwed
up after a while.
*/
if ( newobj != editobj )
{
objc_edit( tree, editobj, 0, &idx, ED_END );
edit_obj = newobj;
objc_edit( tree, editobj, 0, &idx, ED_INIT );
}
}
if ( events & MU_KEYBD )
{
/*
This does absolutely nothing to the editable fields.
```

```
*/
if ( !form_keybd( tree, editobj, 1, key, &newobj, &newkey ) )
{
return( newobj );
}
if ( newobj != editobj )
{
objc_edit( tree, editobj, 0, &idx, ED_END );
editobj = newobj;
objc_edit( tree, editobj, 0, &idx, ED_INIT );
}
if ( newkey )
{
objc_edit( tree, editobj, newkey, &idx, ED_CHAR );
}
}
}
```

Any suggestions will be greatly appreciated!

From: mjr@geob7.geo.uni-bonn.de
Message-ID: <30hgk8$djq@news.rhrz.uni-bonn.de>
Source record: 31298

To all who don't follow the discussion on Atari Linux:

Linux has been ported to the TT and to the Falcon. STs with 68030 accelerators and the Medusa are not supported. ST(E)s without 68030 accelerators cannot be supported since there is no MMU to support virtual memory.

In my opinion, MiNT can be made so much unix-lookalike that only the possibility of having virtual memory is a real argument to favour linux over mint (but i feel it is indeed an extremly strong argument).

Greetings

>Could anyone also explain why a program that works fine on 2M STe's won't work
>on some 4M STe's despite not making any different use of memory?

Some programs do not understand that screen memory lies at the end of the
memory. On a 2 Mb machine it will use up the last 32k of memory, any write
beyond that 32k lands in the unused 2Mb zone behind the real 2Mb of memory.
As the ST(E) generates DTACK (memory acknowledge) signals for the whole 4Mb
it won't do any harm. But when 4 Mb is present, writing beyond screen
memory lands in unused space and the system gives a 'bus error' (bombs
away..) I had several programs which did not run properly on a 4 Mb system,
by writing a small loader program which set up a new (larger) screen
somewhere else in memory and then launching the troublesome program solved
the problem.

On my TT nowadays it isn't a problem anymore because it can have up to 8 Mb
of ST RAM and this was never possible on a 'normal' ST...

3914. Re: GFA memory management

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-19 22:12:47 UTC
From: chris@buran.fb10.tu-berlin.de
Message-ID: <30hj4v$of2@brachio.zrz.TU-Berlin.DE>
Source record: 31293

AFAIK there is only one bug in the GFA memory management, but what
a big, fat, hairy one. This sample listing is taken from
GFA_PTCH, which is available in several mailboxes (doc in german only)

```
' Compilerversion mit $m
' statt RESERVE
RESERVE 1000
$m 4711
' RESERVE damit's etwas schneller abst�rzt aber eigentlich unn�tig
' Die (**) Zeilen braucht man beim Interpreter, damit
' nach dem RESERVE auch wirklich danach (FRE() MOD 16) == 0 gilt
' minus 4: wegen Backtrailer bei rest16$ beim Compiler falls $m XXXX
' mit (XXXX MOD 16)<>0
rest16%=(FRE(0) MOD 16)-4 ! **
IF rest16%<0 ! **
ADD rest16%,16 ! **
ENDIF ! **
rest16$=STRING$(rest16%,0) ! **
' (FRE() MOD 16) == 0 jetzt erf�llt
str$="AHAH"
DO
@crash(str$)
LOOP
PROCEDURE crash(str$)
str$="OHOH"
RETURN
```

The remarks roughly say: Use $m instead of RESERVE in the compiler.
It crashes when a function/procedure is passed strings as call-by-value.
Since the strings have to be copied for this, a garbage collection can
occur. Under special conditions this causes a nasty crash (the system
usually locks up)

To avoid this, call a function that does something like

```
IF FRE()<2000
~FRE(0)
ENDIF
```

before every call of a procedure call that passes strings as call-by-value.
This avoids unreasonably frequent garbage collections that could slow
things down, but makes sure the call does not result in a garbage collection.
Since I did this, my GFA programs never crashed unpredictably again (BTW I mostly use
C now anyway). Call-by-reference is harmless BTW. I'm not sure about
local strings, I'm too careful to use any.

This bug has been known for years, but Frank Ostrofsky at GFA never fixed any bugs since about 1991 when they went for the DOS/Windows market, though they continued selling a buggy product. This single bug probably causes most GFA programs to run instably - unless you know the magic lines. Things like these really go against my programmer's soul. I heard GFA has big problems now. Hope they drown quickly :-)

Angrily,
Christian

Is it just me, or should this be added to the FAQ?

Every couple of months (or so it seems) someone who's feeling jealous of
the PC and Amiga newsgroups suggests that we should create a zillion new
Atari newsgroups, as if it were some sort of competition. There are a
couple of problems with this:

1) People already cross-post inappropriately between comp.sys.atari.st
and comp.sys.atari.st.tech (like this message...).

2) Adding more newsgroups isn't going to create more traffic (except for
the inevitable cross-post-mania) or, for that matter, more interest
in Atari computers.

3) The current bandwidth in comp.sys.atari.* doesn't justify creating a
half-dozen more newsgroups.

Did you see the GNU C/C++ 2.6.0 announcement?

Atari SysV UNIX is now supported... what the hell!?!? There must be,
oh, a dozen users of Atari SysV UNIX (for the TT030) out there...

Last I heard, they still wouldn't include Jwahar Bammi's patches in the
main GNU C/C++ distribution (which is why he posts them to
atari.archive, usually a little while after FSF releases a new version)
for Atari TOS/MiNT support. Which AFAIK has probably 100,000x as many
users as Atari SysV... strange, eh? Must be because the configure
script won't (usually) run properly on an ST...

There are two instructional files on atari.archive.umich.edu that deal
with floppy drives. One is genflop.lzh, the other ibmflop.lzh (or something
like that). Grab the 0index file to find them. Hope that helps.

I think one thing that some one has forgot to think about, that its a good sign that these old Atari are being put up for sale, my reason is that they could still be used, not just trashed or put into the basement/garage and never used again..

A few people here would rather do just that, put them in there basement, be cause of what they payed for them and the low price they would get for them, so they don't sell them, funny logic that is...

>That compiler claims to support Speedo-GDOS, Falcon, MultiTOS, etc quite well.

I don't have HiSoft Basic 2, but I do have Power Basic, which supposedly
is Hisoft Basic 1. And this basic is really very good. I can have access
to the entire OS, I was even able to write some cookie routines. I heard
that version 2 is even better, so if you want to try HiSoft Basic is
might be a good idea to get the very cheap v1 first. You can upgrade
later. The best thing about HiSoft basic (and the reason why I bought
it) is that it is compatible with many basics, from ST-Basic to GW-Basic
(which is handy for the Natuur & Techniek simulation programs ;-)

CEO file contents:
Hi Ian,

I don't think you have a speed problem. In fact there is a bug/feature in ST memory management so you can only have 1/2, 1, 2, or 4Mb. All other combinations fail to work properly :(

However ther is a way to use your extra .5Mb. you need to boot with the program MEMFIX.PRG (or is it MEMMFIX ?) in your AUTO folder (first program). This one is available on the a.a.u.e. It has been said that there are sometimes incompatibilities with some programs, and games have to be booted after MEMMFIX. Also keep a backup boot disk because you won't be able to boot your Atari without this or taking out the 512Kb.

So you have the choice: either 2.5Mb and a few drawbacks, or you take out the 2x256Kb Simms and stick to a 2Mb configuration and you are completely compatible.

Hope this helps...

Wouldn't it be possible to connect a switch somewhere on the extra SIMMs to turn them on/off depending on whether you need the .5 or not ?

Nick

>the 256K SIMMs in the STe to take it to 2.5Mb, but can't get it to work. The
>beast gets to the stage of loading the HD boot program, then stripes the
>screen and hangs.

The problem is that the STE's MCU assumes all installed SIMMs are of
the same size. I don't remember which bank is which, but the STE has
two RAM banks, arranged as:

rear of STE

```
----------************
|
Bank 1 ************---------
| |
----------************ Bank 2
|
************---------
```

front of STE

Like I said, I forget which bank is which, but if the first bank has
1MB SIMMs, the STE will assume any SIMMs in the second bank are also
1MB. If you put 256K SIMMs in the first bank, the STE will assume
any SIMMs in the second bank are also 256K SIMMs (this will work
with putting 1MB SIMMs in the second bank, but you'll end up with
only 1MB RAM total).

In order to use 2.5MB on an STE, you need one of the 'fixer' programs
(SIMMFIX/SIMMFIX2 was one, plus there was another one that I'm not
sure about the name on (it was on an ST FORMAT cover disk)). The docs
for these program SHOULD tell how how to install the SIMMs correctly
and then you just need to put the program as the first executed file
in your AUTO folder.

The way the fixer programs work is by having you put the 1MB SIMMs in
the first bank and the 256K SIMMs in the second bank, making the STE
think there's 4MB RAM total. The AUTO program just tells your
machine that the upper 1.5MB isn't available for use and then you
just HOPE all the software you run doesn't bypass TOS trying to use
that non-existant 1.5MB (some games do this, so if you want to play
them, you'll have to open your machine up and take the 256K SIMMs

out). Due to some of the problems that can occur, it's probably
better to either just use 2MB, or go ahead and upgrade it to 4MB.

You need simmfix.prg from a.a.u.e in directory Ste. This'll allow
TOS to recognise that you have 2.5Mb, otherwise it assumes you have
4Mb. When you've got your Ste set up with 2.5Mb you'll have to _always_
boot with simmfix whenever the Ste is turned on (or after a cold boot)....

> I'd like to know how to use the DSP56001'sin tables and what are the values
> represented ?

How to use: first enable the internal ROMs, so that they appear in your memory space.

```
ori #04,OMR ;enable Data ROMs
```

The 256 point 360 degree sine table will be mapped into y space at y:0100 - y:01ff. Setting up some pointers makes it easy.

```
move #$0100,r2 ;ROM sine table
move #$0001,n2
move #$00ff,m2
```

Then set n2 to be the integer offset into the table, and grab a point with something like this:

```
move y:(r2+n2),b
```

You can print out all 256 points for yourself, or they are documented in the Appendixof Motorola's document DSP56001/D. Order it. But briefly:

```
y:0100 = 0.0000000000 = 0 degrees
y:0140 = 0.9999998808 = 90 degrees
y:0180 = 0.0000000000 = 180 degrees
y:01c0 = -1.0000000000 = 270 degrees
y:01ff = -0.0245412998 = 359.? degrees
```

You can interpolate between points for more accuracy. --steve

I've had this problem with not being able to copy folders to floppy before.

Your floppy is a preformatted DOS disk, right? That's the problem.

Reformat the disk from the desktop and it's guaranteed to work properly.

3927. Sound Recording???

3928. Help! dead floppy after memory upgrade.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-20 18:06:27 UTC
From: daveh@netcom.com
Message-ID: <davehCt93Ms.Cq4@netcom.com>
Source record: 31309

Last night I spent several hours soldering 2 x 1Meg simms into a Mega ST (not E) after I had soldered the 50 or so wires from the simms to various points were the second bank of memory should be and adding the 3 33ohm resistors. The machine then ran fine of the hard disk but the floppy will not recognise most disks. After many tries I managed to copy a memory tester of a floppy. The memory tester reported no errors in either the original bank or the new bank of memory.

A few other facts:

Bank 1 is 16 120ns 1megabit drams (on mother board).

Bank 2 is 2 1Megx9 80ns simms (parity disabled) these are wired by short wires (<4inches) to the motherboard.

The new simms are located below the floppy but well insulated.

Is there any way my memory upgrade could have affected my floppy or is it just coincidence? If I do have a dead floppy can anyone recomend a good source for a new one? B&C and Best whant to chage $150 for a 720K drive!

Many thanks,

Dave.

Message-ID: <28942JFKDHVETMCWUYB@ars.ath.forthnet.gr>
Source record: 31313

I am writing a big commercial application which requires the use of
many databases.
For the develloping i use TT030 and Pure C.
Everything was ok until i tried to run the (ready) program on a falcon
with 4MB ram/430MB IDE HD: The falcon OS didn't permit the openning of
more than 26 files at the same time!!!
Is there any way to increase this limit?
Thanks in advance.

Note 1: The Falcon OS is 4.04.
Note 2: The problem dosn't occurs on a MegaSte with 2 MB RAM or ST/TT
Note 3: I tried both Atari driver 6.06 and XHDI utilities.
Note 4: Maybe the number of 26 files seems too big to be reached, but
when you are using databases with four or five index files
eache...
Note 5: The same limit exist and under MultiTOS.
Note 6: For anyone is interested about: on a TT030 (TOS 3.01) is
possible to have 74 different file handles at once. On Falcon
only 26.
Note 7: For the test i used both open function of Pure C and Fopen of
GEMDOS.

Please, any idea ?

Well after playing with a Demo version of Coma 210
plus the early ones, it looks like it could be the best
Fax program for the Atari...

Good Points....

1. Has a built in Text Editor, I have not found this with otheres
that I have managed to play with..

2. Very Easy to use...

3. Uses IMG format for pictures, well supported for the Atari..

4. Can access Fax messages remotely, I think this is a first..

5. Works in Medium Res, some otheres don't..

6. Built in debuger..

Bad Points..

1. Doc's are all in German, a Big minus here...

2. No class 1 support, not a big minus if you buy a good modem..

3. No Voice support for Linelink modems, or any support for Linelinks..?

So have any otheres have any other Faxinfos, good points bad points..

Just my 10c worth....

Could anybody send me a binary dump of eproms of the TOS 1.62
TOS 2.6 and TOS 3.6 (or only one of them) , I've the french
versions but i need the english ones . For using with a JUNIOR
PROMMER (add a recent version of this soft if you have) .
I've made some modifications on the frenchs tos what I would
take on the english versions.

My MAIL ADRESS is :

Regis BAUSSIN
21 Rue TREZEL
92300 LEVALLOIS
FRANCE

If I succeed you will receive the fixed versions.

I search a sailor of the "AJAX" chip , the HD 1.44Mo FDC , at low
price for 1 to 10 units , maybe more .

What the "rate" of the comp.sys.atari.st.hardware ?

Thanks.

Another little Hard-Drive tip I've found.....

Often, when using the ICD-Booter, holding down ALTERNATE won't always boot from the AUTO folder of the disk in drive A:. So, to fix this problem, do a keyboard-cold reset (Control+Alternate+Right Shift+Delete), and then when the drive light blinks off for the 1st time after the reset hold down ALTERNATE for about 2 seconds (Until the hard-drive blips and stops), and about 95% of the time, the AUTO folder will be booted from, not just the boot-sector!

Turning the machine off & on again never seems to work....

(Small variations work as well, but this seems to be okay....)

Julian plus otheres that put files on Archive sites, Please Please could you rap them up with say LZH/ZOO or ZIP, this is because TOS/PRG/ACC/TTP and MSA extensions can't be access via most Gopher servers, this due to Admin staff not setting up the Tables to reconise these extensions as Binary files...

The same I have found with Jpeg files, Gopher servers think these are Text files and not <Picture>...

ICD were selling out ADspeed, its also a 16 mhz Turbo 68000 with 32k of Cache, the STE version can also have a FPU...

Easy to install and the ST/Mega version is very small....

The ST version was going for $100us, far cheaper than Hypercache...!!!

You need to buy one of a variety of audio sampler cartridges --
Microdeal's REPLAY series of cartridges seem to be the main ones
available. They plug into the ST's cartridge port and have RCA
phono jacks on them. New, they cost anywhere from $50 to $100+
depending on which one you buy (basic 8-bit mono, 8-bit stereo,
or 16-bit). Used, you can sometimes find the basic 8-bit mono
sampler cartridges for $30 or less.

Gee 50 wires, there are only 30 pins on a SIMM board, and most of these
pins are connected together, plus 8 more for the upper data bank and one more
for the bank select line, no way near 50 wires....

You did stick the SIMMS on top of each other..?

I can't see how a memory upgrade can affect the disk drive unless you don't
have 5 volts and may be 12 volts for the drive, or the track alignment
has got out some way or another, does it work with its own new formated
disks..??

yes try the good old FOLDERxxx.PRG for the AUTO folder.
This program will increase the buffers for Malloc and Filehandles.
AFAIK it works on _all_ TOS related OS's.

Sorry, but Steve wants to have Gemini self-extracting, and he win't change
that just because there's one program on the net which can't access them.

Except the original poster also tried under MultiTOS, and as far as I
know, MTOS doesn't need FOLDRxxx (because the MTOS memory management
is completely different from TOSes).

Still, it could be worth a try.

yes the memory managemanet is different, FOLDERxxx will change this to a
static managment (for open folders and open files).
As FOLDERxxx only acesses documented TOS variables (AFAICR) it should work
with MiNT and MTOS.

You may also give the famous harddisk driver HUSHI a try. There you can
set the maximum space allocated for such things...

Chris Herborth (cherborth@semprini.waterloo-rdp.on.ca) wrote:
: In <2vjdqt$p8p@aiscube.AIS-Dortmund.DE>, Theo Janssen writes:

: Is it just me, or should this be added to the FAQ?

Don't know, what do YOU think ?? ;-)

: 1) People already cross-post inappropriately between comp.sys.atari.st
: and comp.sys.atari.st.tech (like this message...).

Yep, that's true. Anyway:

- i never ment to create more groups for cross-posting.

IMHO this is a problem of those "cross-posting maniacs", not a problem
of the net. But _just beacuse_ there is so much cross-posting here, it's
probably useful to have more groups. With just two most used groups here,
i believe we have a very "crossposting-friendly" enviroment.
Think about it ....

: 2) Adding more newsgroups isn't going to create more traffic (except for
: the inevitable cross-post-mania) or, for that matter, more interest
: in Atari computers.

- i never ment to create more groups to create more traffic or more interest
for Atari computers.

Seem's you really have a problem with cross-posting/cross-posters, but
as i said; Crosspostings are created by users, not by more groups.
For that reason it's IMHO not a solution to avoid cross-postings by
having only a few groups. Where is the end ? Only one group, so we
don't have crospostings anymore !!???

: 3) The current bandwidth in comp.sys.atari.* doesn't justify creating a
: half-dozen more newsgroups.

What bandwith DOES justify more groups ? 10 Articles/per Day ? 100 ? 1000 ?
and who decides which bandwith does justify more groups ?

My idea was, to create more groups, so that everybody can read and write
in sections of special interest, he or she is interested in, relating to
Atari-Computers. Just have a look now at c.s.a.s and c.s.a.s.t and count
all those "for sale ..."- or "where can i find ...."- or "what program to
use .."- articles, mixed together with articles of people who disuss
heavy programming-problems or whatever.
Don't get me wrong, it's really ok that people ask. At least that's of
course what this net is for, but why EVERYTHING in just two main groups

and than often in both groups at the same time (yes, cross-postings) ???!!!

Answer: Because there ARE only two mainly used groups !

I personally would really enjoy to have a section of which i know, here
i can read all those things about my Atari i'm interested in.

But maybe, this disussion is useless, because nobody has contacted me
yet, and i won't do all the work alone, that's for sure.
If so, we'll keep on having two mainly used groups, and you can keep
on being annoyed about cross-posting .. (sorry, couldn't resist)

cheerio Theo

What's the big problem? Why doesn't some who has the self-extracting
archive just ZIP (or whatever) the archive so it can be accessed by *all*
systems. Un-ZIPping it would then leave you with the original
self-extracting file, and everyone would be happy.

Source record: 31328

Hi! My system just crashed for no apparant reason, and I was hoping someone would have an explanation.

What happened is that two characters I typed started being printed repeatedly to the screen, until the program I was in (Storm) crashed back to the desktop, then in few seconds bombs appeared and everything hung.

I'm working on a MegaSTE 4, but this isn't the first time I've encountered this problem; back on my 1040STfm this used to happen periodically, mainly in WordUp. I don't *think* it's a virus, as I have Protect6 and it doesn't give me any warnings (except when unarching ZIP and ZOO files). Anyone else ever have this problem? Know what it is? Could it have something to do with Warp9 (or QuickST, as I think it did it before I got Warp9, too)? Version 3.75 on Warp9, BTW.

Thanks,
Tom

Date: 1994-07-21 18:05:17 UTC
From: nemetz@bigdog.engr.arizona.edu
Message-ID: <30mdct$9a2@news.CCIT.Arizona.EDU>
Source record: 31330

I want to test some DRAM and a DRAM controller I recently got from surplus by adding 2Meg of RAM to my Mega ST4. I will use the internal Expansion Bus.

I know that the memory space: $C00000 - $CFFFFF is free for me to use. This is only a 1 meg space; does anyone know if the Mega ST has anything mapped into the 1 Meg memory space after (or before) the $C00000-$CFFFFF space? I'll page in and out 1 Meg chunks of memory if I have to, but I rather not.

I don't care if I use parts of the memory map that Atari has reserved as long as there are no hardware conflicts.

Thanks for any help,
Brian K. Nemetz

Well no I found it more fiddly wiring the address lines together on
the simm so I just soldered then to the motherboard. This was still
easyer than desoldering 16 chip locations and a damn sight
cheeper. ($55 for some second hand simms and a pile of shredded ribbon
cable.)

: I can't see how a memory upgrade can affect the disk drive unless you don't
: have 5 volts and may be 12 volts for the drive, or the track alignment
: has got out some way or another, does it work with its own new formated

I solved this also, when removing the floppy I disturbed my GCR extra
shielding (ie. pile of baking foil) so that it was rubbing on the
motor wich slowed things down just enough to cause problems.

Dave.

3953. PAK3/33 accelerator in MSTE (repost)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-21 23:30:31 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <CtBDAv.C2x@cix.compulink.co.uk>
Source record: 31334
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Apparently usenet messages haven't been forwarded from CiX in recent days, so you've all been spared my comments ;-)

However I'll report the following one just in case it didn't get through:

I'm seriously thinking of getting a PAK3/33 accelerator fitted in my MSTE. This is mainly because I'd like it to run faster, and also so that I can use Virtual Memeory using something like Outside.

I'd be very interested in hearing from any users who have PAK acelerators of any type in their STs, especially if they are using VM drivers like Outside.

I'd also be very interested in hearing from users of *any* type of Atari using *any* type of VM driver.

The programs I'd want to use under VM, would mainly be MiNT/MTOS and GCC. OTOH I'd still like the machine to be as ST compatible as possible as there are other ST applications I use. However its mainly with GCC I have memory problems.

I have heard that GCC doesn't like Outside. Anybody got it to work?

Thanks

Roland.

@CiX

PS I *have* thought about buying a Falcon, but aren't very impressed with it. All the reports so far indicate the PAK3 is faster than the Falcon, and anyway many of the advantages of the Falcon I wouldn't use (sound, graphics etc), or are already built into the MSTE (1.44 floppy). However I am more than willing to listen to arguments in the Falcon's favour ;-)

>
> But with Kobold 2, there is no problem.
>
> Does anyone else have the same problem ?

The problem really exists - in virtually every Falcon I know... =-(
Its origin is a bit unclear for me yet, but some things are clear. It isn't related to Tcache or any utility program. It's a bug of TOS 4.

Curiously enough, it _only_ occurs when trying to copy folders from HD to certain types of 1.44 MB floppies. I may be wrong, but this is the theory: TOS 4 bombs, if you use a PC-formatted (e.g. unused, pre-formatted) disk. A disk with NO Atari-specific info, that is.. I guess, disks formatted on Mac might have the same problem. One thing is certain, however. Disks I format with E-Copy (great copy/format prg!) don't bomb - ever... Neither do FastCopy formatted disks, I think. So, you can draw your conclusions - and try if I was right or not...

Strange but true: when I format a 100% IBM-compatible 1.44 MB floppy with E-Copy 1.63, it won't bomb... When I format a similar disk under MS-DOS, it bombs. So, there is some difference somewhere.

>As a case in point, a Uk magazine reviewed it when it came out last year and
>found you could run Word for Windows on it at a useable speed.

The IBM 486SLC2-66 is a VERY nice chip and only has a external 16bit
bus. On the average SLC2-66 I put together for the PC consuming
individuals I work for I can get 25 FPS in DOOM (using their TIMEDEMO)

More than acceptable. The emphasis for a PC-on-a-card for the Falcon
should be GAMES compatability.... after all, that is all they are used
for anyway.

It is *excellent* news! I've replaced the MTOS desktop and it works
fabulously well, and the colour icons work properly in 16-bit and
24-bit modes etc etc.

Now, if only there was a complete English translation available...

You don't want non-turbo mode. Really. You do need to patch your MiNT
kernel to include the addrootimeout patches - get one of the
Mega-patches from atari.archive.

The emacs lisp files are found in the full emacs source distribution,
which can be found in any good ftp site (and probably some bad ones
too).

Thanks to everybody who answered.

I've reformatted a disk from the desktop, and copied a folder
without any problem.

So there is a difference between MS-DOS format and GEMDOS format.
But I've read in the docs that the GEMDOS format was 100% MS-DOS
compatable.

Under MiNT, one process can only have upto 32 files open at one time,
including the first six reserved numbers, leaving 26 files for the
user. (You can also use the first six handled with some tricks.)
Most modern Unix's have a limit of 256 files per process. If you
really need more files you should try a more sophiticated management
that tries to close some currently unused file descriptors. Note that
if the files are all on a TOS filesystem, there is a *global* limit of
about 80 open files, which is imposed by GEMDOS. Thus if there are
three processes that each have 26 files open on a TOS filesystem, a
fourth process could only open two more files. But if you use other
filesystems (like MinixFS) there is no global limit (other than
available memory).

My Mega 4 STe has of late been having trouble formatting disks
particularly to 1.44 Meg. It most often reads the 720k disks from
my 1040STfm but has great difficulty reading disks from a friend's
Mega STe at either 720 or 1.44.
I ran a speed test on the drive and it returns approx. 302 most of
the time but every now and then the speed drops to 251/266/258.
The average speed is always around 290 rpm (my 1040 averages 302)
Does anyone know what may be the cause of this intermittent speed
drop? -shot drive motor?- and would this speed drop account for
the inability to format/read?
Any advice greatly appreciated,
Peter

For reading a disk, I've found that a difference of even just a few RPM (on a DSDD disk) can make a disk mostly unreadable; my 1040 spins at 300, but my father's 520 tends to spin a little high - 303 or 304 - and we have a devil of a time transfering files. Find out what speed your friend's disk runs at; you may have to try a null modem connection instead of swapping disks. I would imagine that the speed affects formatting, as well, since your system is expecting a disk that spins at 300 RPM, not 290.

Hi Roger!

>Bad Points..

>2. No class 1 support, not a big minus if you buy a good modem..

Yes, but the only Modems I know with FCLASS=1 are the US-Robotics Modems.
And the newer ones of the support FCLASS=2.0 and this option works very fine
in COMA 2.10.
That was the reason, why i bought the programm.

Ciao,
Bertl.

>Brian K. Nemetz

While developing my STGA (VGA-ST-Adaptor) i needed two meg address space.
It was no problem to use $c00000 - $dfffff. If you are using a TOS <= 1.4
you may access to $e00000-$efffff as well. I think the whole space from
$400000-$dfffff (wow 10MB!!) can be accessed by giving it a DTACK.

B

In all the tests (on MegaSTE, ST, TT & Falcon) i have used FOLDR330.PRG
but the problem on Falcon with max of 26 opened files remains.
I believe that only a system patch (as Winx for 8 windows limit) can
solve the problem. Is anything like this on road???

In any case thanks for the answers.

3972. ST and HD not talking

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-22 22:04:39 UTC
From: brianp@netcom.com
Message-ID: <brianpCtD3zr.Hxu@netcom.com>
Source record: 31252

Hi there.
I have a 1986 1040 STf with a BMS-200 ACSI->SCSI board
and a Fujitsu 2249sa 318M (formatted) drive.
The drive and computer stopped talking to each other one day.
The clock setting part of some BMS boot software said it
couldn't find the clock. I took the card to a store, hooked
it up to their system, which could find the clock (which needed
to be set). My ST also had troubles reading floppies. It would
not be able to run programs on many floppy disks. Later, the
floppy drive wouldn't even work at all. On powerup, it would spin
a moment, on reboot it wouldn't even budge. In either case, no
icons. Got it repaired, the floppy controller chip was at fault.
The DMA chip and the rest of the computer were all tested and found
fine.

The ST and HD still aren't talking.
Any suggestions?

Brian Peterson, brianp@netcom.com
(Also, any idea where BMS is now located?)

3973. Fujitsu HD & autobooting?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-22 22:09:07 UTC
From: brianp@netcom.com
Message-ID: <brianpCtD477.IHD@netcom.com>
Source record: 31253

I have a fujitsu 2249sa hard drive (with a BMS-200 adapter)
which I haven't gotten to be autobooting.
I seem to recall someone saying that HDs with too complete
scsi functioning would do something that the atari
(1040STf, just upgraded to 1.4) didn't know how to recognize.
The drive would send some sort of wake-up sequence that the ST
didn't recognize, and thus the ST wouldn't autoboot from the drive.
Does anyone know if such a drive CAN autoboot, and how to do it?

Brian Peterson, brianp@netcom.com

>users as Atari SysV... strange, eh? Must be because the configure
>script won't (usually) run properly on an ST...

That's amazing. I wonder who did the Atari SYSV support. (Probably not
hard, SVR4 is SVR4...) Actually, I think the configure problem is all that
prevents us from getting regular ST support integrated. There's kind of a
chicken-and-egg problem here; if you install all of the other GNU utils
(including bash) then you *can* run everything Just Like a Unix Box. But,
I guess you really need to be running MiNT to have everything work nicely.

There are a couple other things I noted that I've been trying to remove.
There are a lot of ST-specific code segments in the supposed-to-be-generic
GCC code that we can now eliminate because the Mintlib takes care of the
compatibility/emulation problems... If we just cleaned things up a bit more,
things would probably move along nicer for us.

I don't know about other, but my Gopher server won't even show
a file that doesn't have either txt, asc, bin or no extension at all.
The darn thing is setup for UNIX, and that's that! I have to E-Mail
everything but the 0new and 0index from umich. We could really confuse
everyone by using a .bin extension on self extracting files. Then
just about everyone could get them through Gopher or FTP. All you'd
have to do is rename it after you d/led it to your home machine!
Hey I never said it was a perfect solution, just a way around
a whole bunch of system administrators that never heard of an ST!

Hi all...

I put in an Adspeed last night into my Revision D 1040stf. So far it's been nice...somethings run faster, but others do strange things. For instance when I am booting, things that never gave me bombs do now. It seems like half the time something in the Auto folder gives me two or four bombs. (This is in 16mhz mode). I've never gotten 4 bombs as often as now. The question is did I blow the upgrade? I would think that an improper upgrade would render this thing dead...but I am not sure I'd know!

Bye for now,
Matt Koundakjian <mattk@netcom.com>

>ICD were selling out ADspeed, its also a 16 mhz Turbo 68000 with 32k of Cache,
>the STE version can also have a FPU...

>Easy to install and the ST/Mega version is very small....

>The ST version was going for $100us, far cheaper than Hypercache...!!!

Hi Roger,

I bought my Adspeed yesterday from TCN in Glendale, CA, USA for $200.
They wanted $225 but sold it to me for $200. Consequently, I am not sure
that it is "far cheaper"...

It's definitely small, though not as short as I'd like...in my
motherboard the 68000 chip resides under the keyboard between the x and
the b keys, I think...I had to put it in without the socket and it still
pushes up on the shield...

I can't decide (no pun intended) if I am happy with it, as it has been
only 1 day wsince I've had it. Also, it takes a while to figure out what
programs don't like it. The little speed indicator icon seems to cause
more problems than does the speed increase. I have noticed an increase
in 4 bomb errors (illegal instruction) which might be timing errors. I
wish I knew...I'd like it if ICD had included a "burn-in" type program
for people like me with less than perfect motherboards (had to fix two
broken traces)

To the techies out there, would a 68000 function by and large correctly
if any of the pins on it were broken?

Bye for now,
Matt Koundakjian <mattk@netcom.com>

Pleople like you really get up my Nose, you can't buy TOS 1.62 or 1.6,
so were is this chap to go, get Real if you can....

A copy of a old TOS is not going to hurt any one at all, Atari should have got
there act together and recalled all there faulty machines, like the STE problem
the DMA problem the noisy sound problem the lack of 1.44 drive support in the
Mega STE, I could go on and on, but people like you just make me sick....

There are many many firms selling copies of TOS 1.4 and 2.06 in the UK and they
are all illegal copies, I should know I had one of them...

I've heard that it was already possible to connect the Jaguar to some PC or TT computer to program the console.

Does anyone know if Atari intend to release a kit or something to do the same with the Falcon ?

3983. Help: Uniterm on Falcon

Howard Chu has answered this before on the MiNT mailing list: see after
my .sig. In short, mint-1.10-1.10h7-diffs.gz is the latest patch
that brings your unpatched 1.10 to 1.10h7. If you have difficulties
applying the patch, please read the hints at the beginning of the patch
file.

Subject: Re: Patches for MiNT 1.10
Date: Thu, 14 Jul 1994 17:00:04 -0700
Message-Id: <m0qOahB-0000abC@lloyd.com>

Hello, I'm new here, but I've been playing with MiNT since v0.6.

At the moment I'm trying to compile a version of MiNT 1.10 which has all
the up to date patches. I've found the following files on umich

MPatches:

```
-r--r--r-- root root 26137 Jun 3 00:41 mint-1.10-1.10h1-diffs.gz
-r--r--r-- root root 48479 Jul 11 23:54 mint-1.10-1.10h6-diffs.gz
-r--r--r-- root root 3695 Jul 11 19:42 mint-1.10h1-1.10h2-diffs.gz
-r--r--r-- root root 1810 Jul 11 19:43 mint-1.10h2-1.10h3-diffs.gz
-r--r--r-- root root 9060 Jul 11 19:44 mint-1.10h3-1.10h4-diffs.gz
-r--r--r-- root root 8208 Jul 11 19:45 mint-1.10h4-1.10h5-diffs.gz
-r--r--r-- root root 9853 Jul 11 23:46 mint-1.10h5-1.10h6-diffs.gz
-r--r--r-- root root 19667 Jul 11 23:49 mint-1.10h6-README.1ST
```

- but I'm not entirely sure which if any of these patches is what I'm
after. I also keep seeing references to:

mint110-h[123]-diffs.gz

but have never found a file of this name to ftp from anywhere.

I'm trying to keep my MiNT in line to use the new MiNT-Net stuff that is appearing.

In the directory listing above, you really only need the file
mint-1.10-1.10h6-diffs.gz

This is the complete set of patches to go
from mint-1.10 to 1.10h6

All of the other files there represent the incremental changes from one patch set to the next. While we have to suffer and wait for each new bug fix to appear, and thus patch things a step at a time, you don't need to. Just get a complete 1.10 source archive, and then go straight to h6 in one fell swoop. Of course, we're not done yet, so there will be more incremental patches beyond #6, so at that point you get to play the catch up game with everyone else...

It may be 100% _data_ format compatible, but there are timing issues
involved regarding the Inter-Record-Gaps, number of sync bytes, etc.
that may well deviate. (This is all the stuff _between_ your data
sectors and at the start of the track, that you never even think about.)

It's possible that the floppy controller chip in the ST needs a bit
more time to sync up to the data stream than the pre-formatted PC
floppies provide for. Especially when running 1.44 disks, the timing
is tighter. I.e., you have 18 sectors per track, instead of 9, and
the IRG spacing is smaller.

To see the kind of thing I'm talking about, use Knife (from HiSoft)
and do a Read Physical Track & Marks command. You could actually
go in and count the sync bytes, marker bytes, etc. if you wanted.

Yes, there IS a Falcon-based Jaguar dev. kit (I think it plugs into
the DSP port, but I'm not sure).

Somehow, it doesn't surprise me, Roger, that you're advocating
illegal activities. He could always try to find someone selling
USED sets. Also, he wasn't JUST wanting 1.62, but also 2.06
and 3.06, which Atari (or licensed parties) DOES sell. Since
TOS 2.06 IS available, there's no need to sell TOS 1.62 sets!

Why oh why does it work flawless on a TT then ?
I can use whatever PC preformatted HD disks and never got a hitch, just
slip the disk in, copy a folder from whatever partition and it copies...
No the 2 bomb folder copy problem is defintely a bug in the Falcons TOS.

>>Now, if only there was a complete English translation available...

>If only there was any documentation available...

Excuse me? There is quite some documentation in the package imo, although it indeed is all in German. The new version has even some stuff on the new Mupfel (something that was lacking in the previous release unfortunately).

And then, even without any docs at all, I think installing and using Gemini is quite straightforward. Sure, all the deep ins and outs of the Mupfel shell is a whole other piece of cake, but getting a functioning setup isn't that hard. And if you know Unix a bit, and stuff like shell-scripts, it's even easier, since Mupfel resembles those quite a lot.

The only changes I made to the default setup is renaming the 'user' directory to 'usr', and merging the MAN1, CAT1 and CAT1M directories into one big MAN1 directory, since I use a real manpager which expects all manpages to be in the MANx directories... And that's it. Additionally pick up copies of awk, sed, perl, nroff, man, mkproto, and all Julian's tools (mupfeltools and texttools), and perhaps a few more, and you have an unbeatable setup... I really wished there was something like the Gemini/Mupfel pair for my Mac...

>TOS 2.06 IS available, there's no need to sell TOS 1.62 sets!

What is illegal in the USA is not allways illegal in other counties,
so Please don't force your Laws on others...

I also need a Copy of TOS 1.62 as I wish to have that as a back up for TOS
2.06, not every thing runs on TOS 2.06, and I do not wish to have all those
patch programs for TOS 1.6...

There are very little sales of TOS 1.62, and as most of the TOS 2.06
upgrades allow you to switch TOS's so why would people be selling them,
Plus USA TOS is not the same as UK TOS...

So Please don't preach to me, Atari has done more illegal things that all of us
put together, and You are no Atari GOD....

So I will say again Please get real, and stop acting like some God allmighty,
as it is stated in the Bible those with no Sin cast the first stone...

I used to see this on stock 1040 and Mega in 1st Word Plus. The ghost typist strikes again...

> I'm working on a MegaSTE 4, but this isn't the first time I've
> encountered this problem; back on my 1040STfm this used to happen

No. Saw something written about it years ago, but can't recall now what explanation was given. Some internal buffer overwritten? I know it used to happen (1st Word plus) when I had gotten up to a rather quick typing speed and had just entered a particularily fast combination ("the" "ler"...).

The phantom <esc>/F1/! repeating on some machines at some moments, was another oddity.

> Could it have something to do with Warp9 (or QuickST, as I think it did

3996. Megabus / Moniterm problem

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-24 21:13:04 UTC
From: paul@deluxe.textlitho.nl
Message-ID: <EGYUFEUQ22-UP@deluxe.textlitho.nl>
Source record: 31276

Hi,

I have an old Mega4 in a towercase with a Moniterm SM194 monitor
plus a card on the Megabus that drives it. Until recently it worked
fine, but then suddenly it didn't. The image on the 19" gets distorted,
and there seems to be some sort of contact problem. I dismounted the
card several times and put it on again - sometimes it works fine and
then all over sudden the image gets disturbed again. When I disconnect
the card from the bus the image on the screen doesn't change at all -
you get the same blurry picture regardless the card's on the bus or
not. The only thing that seems to help sometimes is (sorrysorry) give
the case a good bash - then suddenly the image is ok again (might switch
back to blurry mode anytime though..)
Between the card and the motherboard sits an accellerator and a TOS 2.06
card, so the standard bus connector had to be extended by extra bus plugs.
But - when I plug the 68000 back on the board and remove all the extra's
and then connect the card without the extensions it still won't work.
Everything else works fine - the machine boots, the screen driver 'sees'
a monitor connected, boots on in TT highres - but all of this with blurry
screen output. Does anyone know what's causing this and how to fix it?

thanks a lot,

Paul

The only Legal way to get a copy of TOS 1.62 is buy an STe that has
this version installed. An otherwise dead STe ought to come cheap!

If you want to replace the internal Falcon IDE drive I believe it must be
a 2.5 inch unit. The most popular IDE drives are 3.5 inch and I don't
think they will fit. That's a good question, maybe someone else replaced
their internal drive...

When my MSTE was new it had these problems among others. It went back under warrenty and had the disk drive replaced. All problems since disapeared, although it still rejects disks which a PC will *grind* its way through to 'successful' formating ;-)

OTOH I also had the following parts replaced at the same time.

Hard disk
Host Adaptor
Shifter

I was trying to get it to run MINIX, but it wouldn't run for more than 20 minutes without crashing. Nothing else ever had a problem.

Roland.

I had this problem earlier. FYI: the patch program in the Utilities directory at atari.archive.umich.edu or any of its mirrors does not accept unified format. The ones in 'Mint' or 'Gnustuff' directories (based on Gnu Patch 2.0 work fine, however (but may need '-l').

I don't have access to an Atari ST dealer and none of my friend uses one.
So, my problem is that I'm looking for ST/Falcon sound samples file format
description (the most common ones) and some ftp sites where to get some.

Anyone can help ?

Thank you much!

(reply be e-mail please)

GEMDOS 0.30 (the GEMDOS in TOS 4.x) has a limit of <32 open files per
process (including the standard handles). FOLDRxxx won't change that.

>You may also give the famous harddisk driver HUSHI a try. There you can
>set the maximum space allocated for such things...

Yes, it does exactly what FOLDRxxx does, this will be no help.

Hmm. There is quite a lot of software that can be compiled unter linux but
not under MiNT. X11 for example and a bunch of other packages.

Neither can I buy a lot of things that are no longer made. Does that mean I
can just go and steal one?

Atari make TOS2.0x. If you want an upgrade, get this. WHy go for an older
version. Do DOS users go and buy DOS3.3 when 6.2x is current?

|> Another person with a very sick attitude....
Not sick, just honest.

|> 2.06, not every thing runs on TOS 2.06, and I do not wish to have all those
|> patch programs for TOS 1.6...
If your software doesn't work on 2.06 then it needs upgrading or replacing.
Buying a computer and or/software does not give you carte-blanche permission
to flout the law just because something breaks somewhere along the line.

|> There are very little sales of TOS 1.62, and as most of the TOS 2.06
|> upgrades allow you to switch TOS's so why would people be selling them,
|> Plus USA TOS is not the same as UK TOS...
Most allow you to switch TOS's so you can keep your older TOS as well as the
new one. They are not made that way to enccourage piracy of copyright OS code.
As for US v UK TOS - I should damn well hope it's different.

|> So Please don't preach to me, Atari has done more illegal things that all of us
|> put together, and You are no Atari GOD....
What has Atari done that's illigal?

|> So I will say again Please get real, and stop acting like some God allmighty,
|> as it is stated in the Bible those with no Sin cast the first stone...
Just stop advocating illegal acts thatyou perceive to be OK because it doesn't
fit into your personal and IMHO shaky view on your rights as a consumer..

>Hi,
>
>I have an old Mega4 in a towercase with a Moniterm SM194 monitor

etc etc

After fiddling around with the card a bit further I noticed this small red copper wire coil on the rear of the card - and it was loose. Wiggling it a bit produced the image on the screen to go off & on into blurry mode. Took the card out, soldered the coil back on - no go. Today a friendly Atari official told me that the coil should be some sort of filter and not essential at all. I then removed it, put a wire between the tin spots on the card - and voila.

But, thanks anyway -

Paul

Hmm the docs to my topline modem say that it is both Class 1 and 2. I'm
not sure what to think of that. Anyway, I have a question about Coma.
I've tried the Coma 1.40 demo and it is quite nice. It should be
compatible to QFax Pro and since QFax Pro from what I heard is no longer
being developed Coma seems like a good alternative (though I'll also
look at Straight Fax, and Teleoffica Fax or something like that) but if
one does not own QFax, where could one get the drivers needed for e.g.
Speedo or some wordprocessor.

Erlend.

Coma has a built in Text editor, so there should be no need for a use of a
wordprocessor....

Also COMA 220 has the FTP option, yes you can now get files and faxes from a
remote site, plus it support voice, none of those other programs come any were
near it.....

So get the Coma 220 demo and find out about all these new things...

If you mean Neodesk, I thought every ST user had it? It's almost as much of a must-have as NVDI, especially on older machines.
Currently at V3 with V4 any day now (say Compo UK who distribute Neodesk over here).

Of course! It's an Atari magazine. Ask your local dealer for it. You MIGHT also want to get the first issue too. It's quite nice.

The address of Two Worlds Publishing, publisher of Processor Direct, is:

Two Worlds Publishing
3837 Northdale Blvd. #225
Tampa, FL 33624
USA

If you are in the US or Canada, you can order a subscription from us. If you're somewhere else, you'll have to talk to your dealer and have him contact a distributor. Also get the address of your distributor and write them yourself. We can't ship to Europe until we a distributor because it's just too expensive.

Roger, even I find it hard to believe that you have the gall to openly admit to piracy in this public forum, to advocate piracy to others, to flame those who denounce piracy, and still bitch about the level of support you think you deserve from fine companies such as ICD.

Your comments trying to rationalize the piracy of Atari TOS ROMs don't make sense. No matter how you try to justify it, it's still an ILLEGAL activity. Add the last I heard, TOS 1.62 ROMS were still available as a repair part.

If you think nothing of stealing ROM code, you probably feel the same way about _any_ software, regardless of the medium it is recorded on.

You apparently have never heard about "International Copyright Laws." Countries may enforce those laws differently, but the rights still exist. And regardless of any written law, you still KNOW what is right vs wrong.

And pray tell, what "illegal" things has Atari done that makes you feel justified in advocating THEFT of their copyrighted code?

Software piracy exists. It likely always will, to one extent or another. I can accept that even though I don't like it. What I will NOT tolerate are people that are so callous and uncaring as to publicly promote the fantasy that a form of 'piracy is OK.' That's a slap in the face of developers everywhere.

It DOES hurt people, Roger. First the developer and then the user. Read Charles Smeton's post about the actions he has been forced to take due to the rampant pirating of his fax software. No, piracy is not the cause of Atari's recent decline... but it IS a contributing factor!

I always knew you were very 'vocal,' Roger, but I never thought you a pirate.

-Hutch- @ Fair Dinkum Tech

P.S.: I apologize for the cross-posting of this reply but I consider it an important issue (see comp.sys.atari.st.tech for the full text of messages).

4016. Major TT & Moniterm VY1000 problem

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-25 20:58:07 UTC
From: paul@vega.ame.arizona.edu
Message-ID: <31190v$nv8@news.CCIT.Arizona.EDU>
Source record: 31289

A few days ago I received a Moniterm VY1000 monitor for use as a high-rez mono monitor with my TT. But I'm having some toubles getting it to work. I got from Samy Mesbah <sasmesba@kingcong.uwaterloo.ca> the following connections, which he uses:

DB15(TT side) DB9(Monitor Side)
5,10 7,8 (these are all ground pins)
4 1 ECL video+
15 6 ECL video-
13 5 Hsync
14 9 Vsync
9--> 10 Mono monitor detect

However, these seem to be wrong for the monitor I have. Using a bit of trial and error, I found the following:

DB15(TT side) DB9(Monitor Side)
5,10 7,8 (these are all ground pins)
4 6 ECL video+
15 1 ECL video-
13 3 ??? Hsync
14 4 Vsync
9--> 10 Mono monitor detect

With 1 & 6 the way you say, everything is inverted, and I can see the scan line going back up the screen. 5, 9 seem to have nothing to do with sync, only 3 and 4. The vertical sync seems to work all right (ie, the menu bar, etc, is where it should be). But the horizontal is all messed up. The left and right edges are very irregular (and moving), and I seem to be able to see each scan line several times across the screen, even a couple times going backwards. My guess is that it's putting the lines at different places at different times. But all of this seemed faily stable.

BUT, now I seem to have shot something in my TT while fooling around with all this, as I now get no picture, and I get no reading from pin 15 on the TT. So I'm a bit frustrated now.

So: has any one with a Moniterm VY1000 had similar problems? Has anyone used the second connection scheme? Any idea where the problem could be (in the TT, the monitor, or the connection) or how I could fix it?

Thanks for your time.

Just some of my thoughts, take them any way
you like...

People refer to Theft as egual to Piracy..!!!

My equations goes like this Software Authors/Programers
egual Pirates....

How come some one can produce a Article for sale (Software)
and find that there are no guarantee that it will work, its often
refered to as Sold as is...???

Also it is often stated you don't own the article at all (Software)
you are only leasing it..? my thouhts are I payed for it I own it, and I can do
what I like with it.

Also they claim that you can't alter it or touch it in any way,

Please Please can I trash your piece of Rubish software....!!

They also claim that if this Article does any damage that they are no liable,
so if it wipes you hard drive tough luck.!!

Plus to get this Article fixed if its faulty (Bugs) you have to Pay..!!

With Laws such as this you deserve to be ripted off, its called tit for tat..

Theft is Theft no matter how you look at it....

Posted to combat this allmighty God like attitude that some Programers/Authors
have..

So Programers/Authors Please take a look at yourselfs as others might look at
you....!!!

PLease note: these are just my fealings on the subject, no one has to take them
personally, but as they say, if the cap fits wear it....

MiNT (MultiTOS v1.08) lacks several features that when available (and implemented) will make it more UNIX like.. although it will never be UNIX.

I hope that Atari works on their UNIX and releases it for their PowerPC (hypothetically speaking) platform and includes an emulator (run-time or binary converter/re-compiler) to enable MultiTOS-aware programs to work on their boxes.

So pinch me.. :-)

I think the point that you are missing is that what you are paying for is not the product itself -- not entirely, anyway. You are paying for the time it took the author to develop the software. You are paying for the distributors and the store that helped bring it to you. (In the case of shareware, most of the time, it is simply a matter of paying for the author's time to develop such a product)

To call software developers pirates simply by the idea that they sell or request a donation for their software is a ludicrous assertion. I develop software. Why shouldn't I be at least in some way compensated for my efforts? I spent ten months working on FANSI. Am I to give it out free of charge and expect nothing in return? To say that those ten months were spent working hours each day on this program while still holding down a day job for nothing? If this is your position, then why? It seems hardly fair that you should get a program that you use and you find worthwhile for absolutely nothing if the programmer expects or requests some form of payment for it if you keep it and use it. If you don't like the program, don't pay for it. But to make the assertion that paying for a peice of software is the equivalent of contributing to your idea of piracy is just plain wrong no matter how you look at it.

> Try the files in doc\ and man\.

Is there an English version available? The version I have (1.999) is
completely in German, and as I do not speak German, it makes using Gemini
nearly impossible, since I can't puzzle out what half of it does.

In <311pqm$kft@golem.wcc.govt.nz> sheppard_r@kosmos.wcc.govt.nz (Roger Sheppard.) writes:

First, I program in my spare time and also make my living with
computers--partly by programming. If I try to make money from that
effort, I believe there are two reasonable results:
A person likes what I've done and buys it, or
A person doesn't like it and ignores it.
The other two possibilities are unfair...that is, a person should not
use the results of my labour without paying AND I should not be able to
make someone pay for something they don't find usable. So, in a sense,
I think you're perfectly right that there's shold be a "tit for tat".
But by both sides acting reasonable rather than both sides acting like
criminals.

>People refer to Theft as egual to Piracy..!!!
...which isn't a really good equation, but at least counters some of the
cute, romantic connotations of the word pirate.

>How come some one can produce a Article for sale (Software)
>and find that there are no guarantee that it will work, its often
>refered to as Sold as is...???
Agreed. Most licensing agreements read as if they were written by
weasels. Unfortunately, I suspect that people with a nasty habit of
bringing law suits for ANYTHING have driven companies to hire lawyers
who create these "cover your ass" idiocies.
Most programmers I know would be ashamed to act that way...it would be
like disowning one of your children to give up all responsibility for
something you created.

>Also it is often stated you don't own the article at all (Software)
>you are only leasing it..? my thouhts are I payed for it I own it, and I can do
>what I like with it.
No more than a hotel room you rent. The conditions of the lease are
part of the product. Once again, if you have problems with any part of
the product (including the conditions), you get to ignore the product
entirely. If enough people feel likewise, the company goes broke...or
maybe changes a bad licensing policy.
Software consumers have made pretty good progress afainst hardware copy
protection by saying, "We ARE paying you and in return you're pissing us
off," to manufacturers.

> Please Please can I trash your piece of Rubish software....!!
Absolutely! If it's rubbish, don't buy it...but don't FRIGGIN' use it
either!

>With Laws such as this you deserve to be ripted off, its called tit for tat..
No, it's called wanting to rationalize being a cheap, greedy thief.

> How come some one can produce a Article for sale (Software)
> and find that there are no guarantee that it will work, its often
> refered to as Sold as is...???

You are not paying for what the software is promised to do, but for what it does now. This difference is important, or we would find ourselves sued for every bug or limitation that someone ran into. Trust me, this has happened in the past to other developers.

> Also it is often stated you don't own the article at all (Software)
> you are only leasing it..? my thouhts are I payed for it I own it,
> and I can do what I like with it.

Do what with it? Make your own copies and sell them? See? It is important that the developer retain clear ownership of the product. If not, someone might try to do something that isn't protected by copyright (or not protected as well). BTW, you are not leasing it, you are licensing its use.

> Also they claim that you can't alter it or touch it in any way.

If you wrote a program. Would you want someone to go in and modify its code? And if they did, and then it erased someone's hard disk, would you want them to sue you (over a change you didn't even do)? See how these problems can get aggravated. Again, this exact example HAS happened. A database company had its program modified by a consultant. The database then damaged expensive records, and the end user sued the pants off the database company. They (the database company) are not in business any more.

> They also claim that if this Article does any damage that they are no liable,
> so if it wipes you hard drive tough luck.!!

See above. Most developers (especially Atari developers) are pretty poor. Just the legal costs for a lawsuit (even if they didn't lose it) would bankrupt us. These DISCLAIMERS are necessary to prevent these problems. Of course, this never really happens (at least I haven't heard of it happening), but you never know. If someone is too lazy to back up their hard disk, then drags the drive to the trashcan by accident, should they be able to sue us?

> Plus to get this Article fixed if its faulty (Bugs) you have to Pay..!!

Again, this is a defence mechanism. We have never charged someone to fix a bug they ran into (all the free patches we've uploaded to online

services prove this). But, if this wasn't in there, someone could sue a developer and demand that they fix a bug for free. In some cases that might be unrealistic (where fixing the bug will take so many resources, that it would bankrupt the developer).

> With Laws such as this you deserve to be ripted off, its called tit for tat..

Tit for tat? Doesn't that infer that we would first get something before we were ripped off? The truth is that we usually get nothing. In the Atari market, a best selling product can, at best, hope to sell to 10% of the current Atari market. Does that mean that the other 90% don't use that product? Take a guess. Find out how many people use UIS, QuickST, or NVDI and then ask them all if they bought it. I'm not blaming piracy for the current Atari market (I never have), but it is something that does affect us developers directly. Trust me, I never was able to buy that lovely house I always wanted.

> Theft is Theft no matter how you look at it....

For once, I completely agree with you.

Please please... can we cool down a bit? I can certainly see why many
folks are provoked by Roger's posting. His stuff strikes me as being
one-sided and lacking any ideas how to tackle the problem (e.g. alternative
systems of software distribution, such as the FSF's concept). OTOH,
his posting leaves me with the impression of being written by someone
who has been seriously bothered by some problems that simply do exist
with the current system of commercial software distribution. Calling
someone who is frustrated and probably annoyed by these problems a
"thief", a "jerk", or stating he shows "stupidity" is missing the real
point and won't do any good. It's merely a step towards a full-fledged,
pointless flame war.

I agree with the position you present in the first two sentences above,
but not in the logic of the third. *Mostly*, the people who steal
software wouldn't buy it anyway...they're too cheap.

The companies that claim they're losing a mint to piracy are just
pulling numbers out of thin air to make a big case and impress the law
makers/enforcers. Even if they could shut down every one of the warez
dweebz, it wouldn't add a cent to their profits. (On the other hand,
focussing on corporate-level theft *might* get them a few extra
dollars...but not those in the Atari software business.)

>heavy-handed, they HAVE TO! It never used to be like this...be then the
>pirates came....
>

Those programmers could of course do something REAL for living... I never expected to become very rich from MY programming efforts... Fact is that by programming for Atari computers you will never earn a decent income (anymore)... Too bad but fact is fact.

The whole system is wrong. If I buy a bread toaster for say $25, I open the package at home (not allowed in the store because of immediate agreement with the rules and regulations on the outside..) only to find out that I need a separate cable and a plug to connect it (referring to crippleware) You can get it to work when you send the maker of the product an extra $10 or so...
That stinks, no one would buy such a product.

I bought a set of CD-UTILS ($50) for my SCSI CD-ROM player only to find out that it also wouldn't read all CD-ROM titles. Ok you can get an update for $?? and also no guarantee... I recently bought a CD-ROM player for my PC and with it came a nice little driver which hasn't got any problems reading whatever CD-ROM disc, the cost of this Mitsumi player was: $75 !!!!! Ok, ok, it's single speed but my SCSI drive for the TT cost me $300 !! Atari computers just aren't any fun anymore, everything for it is expensive (graphic cards, harddrives, memory expansions, you name it)

I'm not interested in putting my whole salary into my TT !! So I admit I sometimes also 'try' software... Here in Holland it is almost impossible to go and look for decent software for the Atari, for a PC you can get everything on every streetcorner. I don't like PC's, I don't like VHS videos either but fact is THEY make the rules.

The last thing I heard was that they were willing to include support
for m68k-atari-mint, but before sending patches, bammi and/or Howard
first wanted to throw out some old kludges for the TOS support that
aren't needed any longer, as the TOS/MiNT libraries do all the
necessary kludging already.

When you rent or lease anything, there's obligations stated for the authors.
But speaking about software, there's no obligations for the author what so
ever.

And how can you ignore a peace of software you'r not able to test ?

>> Please Please can I trash your piece of Rubish software....!!
>Absolutely! If it's rubbish, don't buy it...but don't FRIGGIN' use it

> Everything else works fine - the machine boots, the screen driver 'sees'
> a monitor connected, boots on in TT highres - but all of this with blurry
> screen output. Does anyone know what's causing this and how to fix it?

That Moniterm card (Atari's own) seems to be one hell of a troublemaker... I couldn't get the thing to work with either a Turbo 16 2.0 (16 MHz 68000) or Turbo 030 (40 MHz 68030) acceletor cards at all..! So you're a lucky one, if your combination _has_ worked... Did you have to make any hardware modifications?

But... There are some possible problems: one is the power supply that doesn't seem to be strong enough for even the Moniterm card, let alone both that and an accelerator card (and your TOS 2.06 card..). Maybe you PSU just has partly died. It wouldn't be the first one to do that...

Second, the MegaBus driver ICs are weak in many Mega individuals.. That can cause some strange problems, but I doubt yours is one of them..

Sorry for not being able to help more - but measure your PSU's voltages first. If they are below 5 and 12 volts - maybe that is the reason...

And I would be very happy, if someone knew how that damned SM194 Moniterm card can be made to work with Tiny Turbo 030-40 accelerator together.. ;-) !

Greetings,

Tommi

4038. TEAC drive settings

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-27 06:03:49 UTC
From: mattk@netcom.com
Message-ID: <mattkCtL4uD.lp7@netcom.com>
Source record: 31217

Hi all...

I have a Teac FD-235HF 217-U, P/NO 19307322-17 (all the numbers save the serial number from the back label) that has the following jumpers: D0, D1, HHI, LHI, OP, HHO, FG.

FG has what looks like a capacitor (tiny blue jobby)

I'd like to know how to set the drive. I am using it right now as a double density drive, with D0 and OP jumpered. Using a meter, I tried all sorts of jumper combinations, I tried to get pin 2 to switch from lo to hi with DD and HD media. No matter what I did, pin 2 was always +5 volts WRT the case. The little media hole sensor works...with a HD disk in, the "switch" opens and 5v flows.

The guy I got it from's roommate thinks that it's a special breed of Teac that's only low density. (But I don't know how I could tell that)

Now I could use the media hole sensor to drive a 74F157 (commonly used for switching 8 & 16mhz lines to the FDC) but I don't know if the drive is "switching" densities. Is the only way I can tell to do the mod and see what happens?

Bye for now,
Matt Koundakjian <mattk@netcom.com>

No, "Nodesk" appeared in an ST Review article on Compo, a while back.
It appeared in a photo of one of the developers' desktops.

4040. Falcon, CDs and Bombs

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-27 09:27:32 UTC
From: geoff@damp.apana.org.au
Message-ID: <3159ai$bq1@frisbee.damp.apana.org.au>
Source record: 31226

Help.......

I have a Falcon (Tos 4.01) with 4 megs Ram, 65Meg internal HD, 240Meg SCSI drive, and now a Vertos CD drive (panasonic internals) and am haing trouble copying files from the CD rom to another drive.

I get 2 bombs if coying a single file from the CD to any of HDs.

I can copy a folder of files, usually successfully but will eventually get 2 or 3 bobms after a message saying that the drive isn't responding or some other sinilar message.

I can quite happily read the CD directories all day, and can happily read the files from GemView (it's a CD of space pics(.PCX) in ISO 9660 format and I haven't spent (wasted??) my money on other CDs until I get this fixed.

I am using ICD pro-utils, and have tried HDX and Hushi with the same results.

I am using MetaDos 2.4 with the Falcon drivers from CD Tools.

OK - Is that enough info for one of the buffs out there to give me an answer to solve this problem - be it hardware, CD drive, HD driver, CD driver, or me.

Thanks for the help.

Take care... Geoff

>Please please... can we cool down a bit?
If you read (and understood) the majority of what I wrote instead of just grabbing the last few lines out of context, you may notice that I too agreed with a number of Roger's points.

When I say that, "you deserve to be ripted [sic] off," is a rationalization of theft, I don't consider it an insult particularly. If being ripped off isn't another phrase *meaning* theft, what is it? ...and dreaming up nobel-sounding excuses for screwing others always has seemed to me less honorable than the screwing itself.

There is another problem. The patch that I found on a.a somewhere, had the
code to create a TMP file broken. Specificaly, it didn't work without a /tmp
directory, and then it wanted to create files with too long names. They got
written, but could not be re-opened for reading. I had to get patch sources
from somewhere else on a.a and rewrite the routine responsible for creating
the TMP filenames.

It would probably work if I had a proper MinT running at the time, but since I
was patching Mint...

Just a question... in my months now trying to get MintNet to work properly with my Falcon030, I've come across a few problems. With MiNT 1.10h3 and 1.10h7, dumbterm.ttp will not send/receive and CoNnect 2.46 will not send/receive. STalker will send/receive, but under 1.10h7, the modem will not react to an "ATDT" command. Under MiNT 1.10h1, all the term programs I've tried work.

Now for the MintNet problem. When I run ftp-03, finger, or really any utility, the modem undergoes some sending and receiving, as if it were actually working, but nothing is printed to the screen.

For all of this, I've been running tcsh 6.02. Any Falcon owners have this problem? And does anyone know how to fix it?

A point I hadn't considered....

To be more specific then, when companies, and groups such as SPA,
publish statements such as, "We estimate that there are [x*100000]
pirated copies of product [Y] in the world, each with a retail value of
$499.95. Therefore we've lost [x*100000*499.95] dollars of revenue to
piracy," the lack of logic annoys me. Something in the back of my mind
says, "these weasels are trying to make a case for royalties on blank
diskettes!"

I can always hope that their code makes more sense than their press
announcements.

4055. Copyright Laws...!!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-28 11:56:45 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <3186dt$plm@golem.wcc.govt.nz>
Source record: 31235
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

A few Points I would like to mention about Copyright and the
Laws in New Zealand...

Some of the USA shrinkrap software Licence agreements can no be
enforced here in N.Z, they are just no Legal...

A person that has a Legal copy of TOS 1.6 is entitled to a full
working copy (TOS 1.62) with out the Bugs, by any means possible,
that does mean getting a copy of these ROMs, on this point the Law
is on his side..

This person should not have to buy ROMS at all, also TOS 2.06 ROMs
have problems with a lot of Software, to suggest that this person
has to get the Software upgraded, get real, most of these software
houses no longer exist, how do I update my Copy of Script...?

Also to suggest that you can't alter Copyrighted software, gee look
at all the patch programs for TOS, like KAOS TOS 1.4, did Atari
shut them down, no, as it does not have a case....

A friend of mine a few years back brought a copy from the USA the
Atari Wordperfect, as it was much cheaper than here, some time
later he heard about a update and send his warranty card back to
Wordperfect, some months later he received a letter from the agents
here, asking some $600nz for New Zealand registration, this was
more than he paid for it in the first place, he asked the agents
here what he would be getting for his $600, they could not tell
him...

Since then Wordperfect Corp has instructed there agent here to
have every imported copy of Wordperfect to be confiscated by
customs here, as they hold the Copyrights.....

The same has happened to Apple computer imports, the import
agent holds the Copyrights...

The Problems with all this is that most USA PC software is some 5
times the USA Price, this is also correct for the new Power Macs..

Current exchange rate = 1.66 times the USA $

A person time time back wrote a article in a New Zealand Mag and
refered the software importer/agents as Pirates here, as there high
prices = theft...

One of the Big problems here is schools, they copy any thing they
can get, if a school has 10 PC computers in can't afford to get 10

copies of ther software, they just don't have the money, and the government here does not help at all...

Please Please don't get me wrong I have more brought pieces of software then most of you on this net, I wonder how many of you that has a illegal copy of some piece of software...

Own up those that have illegal copies of UIS III..

And NOTE: I have been asked for copies of Neodesk many time, even last week..

As the Bible states, those with out sin can cast the first stone...

So why not try and be honest with your self ...!!

From a owner a a Rwal Atari computer, nou one of those Copies that I keep hearing about....

Not being a member of the SPA I haven't really paid attention to their statements. However, I wasn't aware that any Atari developers were members of the SPA. So their figures (however innacurate) don't really apply to our market. Trust me, if I was selling 1,000 copies a month of a program on the PC market, I would not be as concerned about piracy. I could at least then maybe afford a vacation once in a while. The Atari market is unique because if we lose 10 sales, it might make the difference that month if we can meet our payroll!

Perhaps there aren't. I work and play in so many different "platform"
markets that I lose track.

>The Atari
>market is unique because if we lose 10 sales, it might make the
>difference that month if we can meet our payroll!
Perhaps not that different...they make more sales; they "lose" more
sales; they have a bigger payroll.

It all comes down to (for the point I was trying to get at) whether you
count one pirated copy of a program as one lost sale. I think that the
people who support that equation are either fooling themselves or have a
hidden (almost) agenda.

If you had some way of knowing that you were being paid for all the
copies that anyone would be willing to buy no matter whether they were
able to steal copies or not, would you still want to stamp out software
theft?

(Personally, I vote yes...not because it makes good business sense, but
because I don't like having a thief think he's made a mark out of me.)

I'm not a pirate personally, but I do agree that things that the
software companies say is blown way out of the water, for example;
when Michael Jackson's largest album was released called Thriller
it made a estimated 400 million world wide, yet they estimated they
lost over another 200 million over piracy of that particular album
due to copies to cassettes etc. Come on, the album cost only a
mere 4 million to produce and distribute@!!! I'm sure that the
young buck at Microsoft is not eating my cat's leftovers. Think,
just think of the dough involved here! Think of how much piracy
goes on in the Dos world let alone Atari, and I believe that we all
know a few pirates on that platform don't we?

This is only my opinion of this entire situation and I still firmly
believe that if everyone was a pirate, of course we would have not
a platform for the Atari at all, but the piracy that is out there
is probably by the most part anyway, by person's who could not
afford the software anyway and the purchase of that said software
would not exist anyway, so I believe why bicker! I pay for what I
use, but this sort of topic is getting pretty old and boring as
far as I go anyway.

From: plord@novell.co.uk
Message-ID: <CtowAB.529@novell.co.uk>
Source record: 31092

Does anyone have a full list of what DMA chips work and which ones
don't in an STE ?

I have the following in my STE :-

C025913-38
PH23-030
9J4 93

Atari UK tell me this is a faulty one ... but they have a backlog of repairs
of about 9 weeks!

Can I use the DMA chip from my old STFM ? Or do I need to buy a new one if
I can't afford to wait the 9 weeks for Atari to replace it.

Thanks,

Pete

Well, if you read the article, you'll find that noDesk will not be
sold outside of Germany.

It seemed to handle LZH (etc?) archives exactly the same as normal
GEMDOS folders, which was clever. (Opening an archive appeared to be
the same as opening a folder on the desktop, if you see what I
mean...)

What will that do for us? I believe Aaron (author of Freeze Dried Term)
tried everything. I'd assume he tried that or knew why it wouldn't work.
I'll have to look that one up because I'm not familiar with it myself.
Thanks for the lead though.

4065. Diagnosing Hard Disks

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-29 17:51:18 UTC
From: Paul Purdom <pwp@cs.indiana.edu>
Message-ID: <1994Jul29.175126.23733@news.cs.indiana.edu>
Source record: 31096

I have a Supra hard disk that has stopped working. The busy light still comes on, but programs do not seem to recognize the logical unit.

1. What is available in programs to diagnose hard disk problems?

2. Has some one had similar problems with a Supra hard disk? If so what was the cure?

The trouble with the disk arose just after the disk when across the US in a car, so I will first reset the various connectors in the unit unless I get a better idea first.

Any suggestions on how to attack this disk problem are welcome.

p> I can't afford to wait the 9 weeks for Atari to replace it.

No ,you can't use the FM DMA chip on an STE. What would then be the
point of having an STE rather than an STFM?

Try to get (or buy) the DMA chip from Atari and replace it yourself.
It shouldn't (hopefully) be a very big problem.

I know all about people who use software they haven't paid for.

I've gotten first, second, and third-hand reports from all over the world
about people who use and absolutely LOVE ANSITerm.

Yet the number of registrations totals to just over 30.

I've had countless requests for version 1.90 (the unregistered version),
but I never hear from these people again. They do not register.

No, programs should NOT all be released as shareware because most people
are not honest enough to pay for shareware software that they frequently use.

4071. Tera Desk/G+Plus problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-07-30 03:35:04 UTC
From: vicb@clark.edu
Message-ID: <31chp8$7k@clark.edu>
Source record: 31107

Has anybody ever had any problems with G+Plus and Tera Desk?

My G+Plus installation file has two programs listed, one of which is the spreadsheet OPUS. I have TOS 1.62, and from the TOS desktop have never had problems running OPUS with G+Plus.

The first time I call up OPUS after entering Tera Desk, G+Plus gives the error message, "Fonts/Device drivers in use; Default devices installed," rather than simply loading it up as it is supposed to.

The second time I call OPUS from Tera Desk, G+Plus loads in the proper ASSIGN.SYS file as it should normally. However, upon exiting OPUS, all windows and dialogs on the desktop show up with the windows and window text in the background color; all I get is a border of the window, although I can interact with them as normal (I just can't see what they are saying.)

Anyone else ever encounter this problem? I can duplicate it 100% of the time.

Any help will be appreciated; thanks--

Yes, I experienced the same problem, which is why I stopped using TeraDesk on my 1040 (now that I've a TOS 2.06 MSTE, it's not a problem :-). As near as I can tell, this happens because TeraDesk actually uses GDOS to replace the system font, and since TeraDesk is just a program (not an extension or what have you), it grabs GDOS and doesn't let go when another program is run. G+PLUS, I think, alters parts of VDI/GDOS to change the drivers when a program is run, and won't change those drivers when another program is using them. Sorry that's such a rough explanation, but it about matches my understanding. Maybe someone else can offer something better.

Great! I'm hoping we'll see an English version ... as it's a shame when
a decent program never gets translated to the English language so that
the majority can enjoy it. I did check it out briefly, but the fact that
it was all in German made giving it a fair review next to impossible.

The line width register expects the width of the screen in WORDs not
pixels AFAIK. Therefore for a 320 screen you should use 20.
i.e 320/16 = 20

Look for DSP_MOD.TTP on some FTP sites -- it includes source code for
playing 4-channel MODs on the Falcon's DSP.

Jabran Akhtar (jabrana@powertech.no) wrote:

: p> Can I use the DMA chip from my old STFM ? Or do I need to buy a new one if
: p> I can't afford to wait the 9 weeks for Atari to replace it.

: Try to get (or buy) the DMA chip from Atari and replace it yourself.
: It shouldn't (hopefully) be a very big problem.

Well .... over the weekend I de-soldered the DMA chip in my STE and put in
a socket. Plugging in the DMA chip from my old STFM worked a treat! My
hard disk is now up and running nicely.

: No ,you can't use the FM DMA chip on an STE. What would then be the
: point of having an STE rather than an STFM?

I don't understand this. Is the STE DMA chip somehow different to the
STFM one? (The reason I moved from an STFM to an STE is that my old STFM
was getting very unreliable (I think due to the MMU socket) - I did my best
to sort it out but I saw an STE going cheap ....)

Do you think it is worth me now buying an STE DMA chip?

Many thanks,

Pete

In my case, it's the fact that I'm dead broke ... but, see below about
part of the reason for that.

> Yet the number of registrations totals to just over 30.
>
> I've had countless requests for version 1.90 (the unregistered version),
> but I never hear from these people again. They do not register.
>
> No, programs should NOT all be released as shareware because most people
> are not honest enough to pay for shareware software that they
> frequently use.

Indeed. I know that FANSI has recieved around 200 downloads from GEnie
alone. Yet, the total number of registrations I have recieved is 6.
Now, granted, not everyone who downloads the software is going to like
it, and still more won't have a use for it, but I would expect that
some of those people would register; only one of the people I have
gotten a registration from has a GEnie account (excluding one of my beta
testers who's also a GEnie member - he's the one that reports download
counts to me), and I believe he got his copy from Strobe II BBS from word
of mouth from the SysOp there who registered my program first.

No, there don't seem to be a lot of honest individuals who register
software. I have tried to take some precautions to encourage people to
register my program -- disabling some of the more important features...
perhaps I _should_ have disabled saving.

Now, granted, my program has only been out there for a tad over two
months... but even so the response, or lack thereof, is somewhat
disheartening. It couldn't be from lack of distribution -- I've gotten
mail from Germany about my program.

Shareware IS a nice idea ... unfortunately, it's less than ideal, and it
doesn't seem to work as well as it might.

Mupfel and Gemini work well with MiNT. In fact, Gemini is the only desktop I know of which supports long filenames.

Gemini is a desktop, not a replacement for AES.

But if someone else did the translation and handled shareware
registration in the UK, would this be a problem? After all, there are
bound to be *some* extra registrations because of the UK support.

Hello. there,

Can anyone tell me what is GEM? I'm using(exploring?) mint on my Mac, and is curious with everything that works with mint.

Also, what is mgr? and what's the difference between xxx, xxx.ttp, xxx.prg? If the error message is something like unexpected '(', what is this supposed to mean?

MacMiNT is still buggy, but I love it. And yet it's not easy to treat a mac as an atari ST.

|A `real' manpager? :-) Obviously not. Normally, you have man* (with nroff files)
|and cat* (with formatted files) folders in one man folder.

I know, but I don't like to have all the original nroff files hanging around,
while I never use them anymore after formatting. So I put all my manfiles in
man1-man9 (?), which in turn are all in man/ of course. Quite a bit more
logical to have man-pages in man? directories instead of cat? dirs imo...

The shareware program Portect6 works great for me! It's a monitor-type antivirus which runs from the auto folder and checks for executable boot sectors and programs attempting to alter executable files. Registration is cheap (forget the actual amount). From Lars-Erik 0sterud.

I cannot help you with programming information, but you might be interested
in knowing that there are a couple of ways to use the faster ports without
any code modifications (given that your goal is to get a faster port).
Perhaps the easiest is to use HSMODA04 to bind a faster baud rate to whatever
you are currently using (for example, you could tell your program 1200 baud,
but it would really come out to be 57600 or whatever). Then, you can use the
serial CPX with Xcontrol to tell your machine to use a fast port instead of
MODEM 1. This should have the effect of allowing programs that are only
spec'ed for 19200 and below to use faster serial speeds.

If your goal is to use multiple ports, this will probably not help.

I might be wrong here ,but the DMA chip on an STE was also
responsible for the replaying of samples (replaying of samples
via hardware so they don't take up extra processor time).
The bass ,treble and stereo control was also provided by it.

Try to use a sample replayer for an STE on your STE ,and
most likely your machine will hang up .. . [Unless the
cookie jar reports that the DMA replaying isn't avaliable ,but
I don't think it will.
Run a cookie jar reporting program to check that out.]

>Do you think it is worth me now buying an STE DMA chip?

If you don't run sample-independent musical STE software on your
machine and you don't exprerience any other problems then you
probably don't need the new chip. On an STE a few games also
take advantage of the DMA chip ,and if they won't find the
DMA chip the game will most likely not run.

But then since you still have the original chip you may always
swap the DMA chip on the machine when want to play STE games (-:

Graphical Environment Manager (I hope ;-)

All the graphical routines which make up the GUI plus lots of other
assorted stuff. Its main user interface is the 'desktop' which does much
the same as 'finder' I believe. Its all normally held in ROM, and the ST
usually boots direct to the 'desktop'.

>Also, what is mgr? and what's the difference between xxx, xxx.ttp, xxx.prg? I

MGR is a Bell labs GUI which is a little like X-Windows. MGR is quite
small, essentially free and very portable, which is why there is a port
of it for MiNT.

I sure some more detailed answers will be forthcomming ....

:-)

Roland.

Hang on, doesn't the STE have the stereo sound hanging of the micro
wire bus not the DMA chip directly? I thought the ST and STE's DMA
chips were functionally identical just differnt drive stats.

SUPER ATARI STacy DEAL!

The Atari STacy is a portable Mega ST with all the standard Atari ports plus a built in monochrome monitor.

At the recent Mid-Indiana ST AtariFest VI, an Atari 4/20 STacy with a special MIDI box and sequencing software was seen for sale at $1700.

The June 1994 Toad Computers flier advertises Atari 4/20 STacys for $1400.

I am selling my STacy for a price below either of these prices and you get so much more:

4 MB of memory
130 MB Maxtor HD
16 MHz AdSpeed CPU
Port for Mega ST keyboard (something no other STacy has)

Plus these items:

Joypad
Padded carry case (very nice)
External Mega STe keyboard (best keyboard ever made)

All for only $1000 plus S&H (US only, please).

Exactly - the original STFM DMA chip _WAS_ the CO-25913-38 - this is the
one that Atari (and others) claim won't work.

>
> : No ,you can't use the FM DMA chip on an STE. What would then be the

No. If it works as is, don't try and fix it (honestly).

I can only re-iterate my sentiments about this, you are not the only one
by any means Pete, I know of several who have had success with the
CO25913-38 as opposed to either of the 2 STe DMA chips. I tried relating
a story in another group to illustrate this but was shot down in flames
by one guy (who will hopefully, look a little deeper now).

There is a lot of HYPE about the DMA and the STFM/STE. If you look
carefully at the STE, it uses the same basic arrangement as the STFM but
has added BUS buffers between the DMA and the outside world and it is
often this delay that makes the already critical timing _too_ critical
and fails to work. This delay is around 12ns (for HC logic) and faster

for the more advanced families. This is also a reason why sometimes a short lead will cure the problems because there are reflections and "ringing" effects in any cable (take a look at VME busses and the lengths they go to with active terminations) and the use of short or better quality cable can often minimize this to a degree where it doesn't matter.

The DMA interface is running at a silly speed for a mutlicore cable and would be better off with decent ribbon interleaved with grounds, to avoid mutual inductance etc. There is a ribbon in a sheathed jacket that comes in a round outer sheath from 3M and I would expect this to extend the maximum length of cable that can be used with the DMA port but I've not tried it.

The real answer is to put the host adapter where it belong, inside the ST and then have a proper SCSI cable to the drives (not practical for many folk I know)....

Cheers, Martin.

4111. Gemulator... any feedback?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-02 04:07:16 UTC
From: dav <burnight@delphi.com>
Message-ID: <5iwQLxs.burnight@delphi.com>
Source record: 31140

Has any one had any feedback on the gemulator? A friend, ex atarian now
using a clone, purchased gemulator and after bout a week he is ready to
send it back... seems like it doesn't work very well and he can't
get it to print out Pagestream files (among other problems)
I would like some feedback from others who may have had or have heard
of experiences with the gemulator
Thanks.... (Email me)

4112. Need Help! (MiNT Net)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-02 04:43:21 UTC
From: jbaumgar@bronze.coil.com
Message-ID: <31kit9$h9f@bronze.coil.com>
Source record: 31142

I posted in another message, but no-one seemed to reply (I suppose the title was a bit imposing). MiNT-Net 0.51 works wonderfully on my ST (TOS 1.04, 2.5MB), but when I try using it on my Falcon (TOS 4.02, 14MB) it does not work.

I run the commands that I am told to run (and that work on the ST), but when I run a utility (ftp, irc, etc...) information is sent to the modem, information is received (as if the program was working), but nothing is sent to the screen.

My personal thought on the subject is that the fault lies in the patched mint I'm using. With 1.10h1, I have no problems sending/receiving to the SCC, but with 1.10h3 and 1.10h7, no term programs function. Is there any Falcon owner who has gotten MiNT-Net to work? Is there a patch available to fix this problem?

Incidentally, a friend of mine with a TT can't get his SCC ports to work, either, but the MFP's work fine.

RS>shut them down, no, as it does not have a case....

We had the problem in Germany - Harun Scheutzow made a bugfixed version of
Xcontrol, and Atari prohibited distributing it. However, a patch program is no
problem - the modification takes place at every end user, and Atari can't sue
all of them :-)

Self extracting archives are a pain - you can't look what's in before
extracting, plus they consume extra file space and download time due to the
build-in extractor routines.
Furthermore, they don't profit from new packer/depacker versions. If I
install a new lharc which runs twice as fast on my computer, the TOS archives
still depack with the old, slow speed.

H>$400000-$dfffff (wow 10MB!!) can be accessed by giving it a DTACK.

It can - however you should be careful that there is *no RAM* directly above
$400000 - the TOS memory test will find it (if you have 4MB installed) and try
to put the screen memory there - which of course fails.

I have a selfmade PAK3/030 running at 36MHz in my 1040ST - it works great. I have tried Outside - it works if you use the supplied HDDRIVER instead of the ICD harddisk driver (I have been told that it is sufficient to turn of the ICD cache).

RG>The programs I'd want to use under VM, would mainly be MiNT/MTOS and GCC.
RG>OTOH I'd still like the machine to be as ST compatible as possible as there
RG>are other ST applications I use. However its mainly with GCC I have memory
RG>problems.

After installing the PAK, there was exactly 1 program that wouldn't work (MAPLE 4.2) - and I noticed that only after quite some time, since I didn't use it anyway.

RG>PS I *have* thought about buying a Falcon, but aren't very impressed with
RG>it. All the reports so far indicate the PAK3 is faster than the Falcon,

It definitely is.

GEM = Graphic Environment Manager. GEM is the ST's GUI and handles
all the windowing/etc. MiNT (and therefore MacMiNT!) doesn't include
GEM, so it won't run any GUI-based ST software on its own.

>Also, what is mgr? and what's the difference between xxx, xxx.ttp, xxx.prg? If
>the error message is something like unexpected '(', what is this supposed to
>mean?

I'm not sure what you mean by "mgr" or what "xxx" is supposed to be
by itself. However, GEMTOS (and official Atari extensions) has
several file formats with the following file extensions:

.ACC - a desk accessory
.APP - a GEM program (doesn't HAVE to use GEM, but generally is
only used for GEM-based programs -- except for system
startup programs in the boot drive's AUTO folder, which
HAVE to be .PRG)
.CPX - Control Panel eXtension (a GEM program that runs from
the Atari Extended Control Panel desk accessory -- like
the Mac's Control Panels)
.FNT - a GDOS bitmap font file (though other font types for 3rd
party applications may use the same extension)
.GTP - "GEM Takes Parameters" meaning a GEM-based program that
accepts parameters via a command line
.INF - only in the case of a DESKTOP.INF or NEWDESK.INF file,
which contain data on how the GEM desktop is arranged,
what executable file extensions are used, and other
system info
.PRG - same as .APP
.RSC - GEM resource file (contains GUI data for a companion GEM
program -- if such data is NOT embedded in the main GEM
executable)
.SPD - a Speedo-format outline font file
.SYS - usually a driver file of some type (printer/hard drive
booter/etc.)
.TOS - a NON-GEM program (many games are in .TOS format)
.TTP - "Takes TOS Parameters" meaning a NON-GEM program that
accepts parameters via a command line

That's more complete than it needs to be, but I thought I'd be
thorough. Anyway, without GEM, MiNT can really only run .TOS
and .TTP programs (and mostly only text-based ones at that!).

Graphics Environment Manager. This is the GUID used by STs and formally by PCs
(before windows). It is made up of the VDI which is the Virtual Device Interface
which handles the graphics primatives and device independance and the AES
(Application Environment Services?? Not sure here) which handles Windows,
dialogue boxes, user interaction etc.

|> Also, what is mgr? and what's the difference between xxx, xxx.ttp, xxx.prg? If
|> the error message is something like unexpected '(', what is this supposed to
|> mean?
.ttp or .tos programs don't use GEM. They are pure TOS/Mint programs. .ttp means
TOS Takes Parameters and is used for any program that needs a command tail like
say a gif viewer may be called gif.ttp and is called by typing 'gif mypic.gif'.
.tos programs will ignore any typed after their name. GEM programs have .prg or
.app as their extenders.

I have this problem with my Mega STE. Maybe it has something to do with the
serial ports in these machines, as compared to a regular ST.

My terminal programs worked until h4 or h6 (I don't recall now) then after
that nothing. I tried with MintNet and without MintNet and the problem seems
to be with MiNT itself.

I boot Mint + GEM, and use Uniterm, then the serial ports work fine. When I
boot Mint without GEM, and do the following:

% echo "ATTD" > /dev/ttya

Then the modem picks up and I hear the dialtone. Apparantly some call to the
modem ports broke in the patches and it has not been fixed yet.

I too have been waiting for some kind of fix to this problem.

4127. Printer port I/O question

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-02 14:43:11 UTC
From: andrewc@cogs.susx.ac.uk
Message-ID: <31lm1v$cj1@infa.central.susx.ac.uk>
Source record: 31151

Could someone please tell me how I can control items trough the printer port.
I would like to be able to output to move a motor/motors and input from
different sensors.

I would very much appreciate if someone could give me an example in GFA/Hisoft
basic, C (prospero? the one given away by ST User i think), or assembly, that
I could use and build on.

Thanks for any help you're able to give me.

Hi,
Just an idea......If I was to drop in a crystal of double the ST's normal frequency, would the thing run twice as fast ? .....or would it throw up all sorts of anomalies like screen updates & disk accesses going screwy ?

I did it once with an old computer I built from a kit, and it worked great !

Jusssssst a thhhhhhhought.

I've been trying to install MiNT 0.95 on my company-owned TT. It's an
exercise in futility. If my hair were any looser, I'd be bald by now.
Does any of you know of a ready-made documentation instructing me
on how to install MiNT on my TT? It's got to be idiot-proof. How about
what files are required to install it properly?

Secondly, I was told that MiNT has an utility to perate SCSI tape drive
on the TT's SCSI bus. Is it true? What do I need to do to get it to work?

Lastly, what do I need to install gcc properly?

From: osantiag@fiji.gesd
Message-ID: <31m5tg$ktl@cnn.MOTOWN.GE.COM>
Source record: 31155

Hey I was wondering if anyone out there has an extensive knowledge of adding a 68030 cpu to the
68000 st's. I saw in a Tiger catalog a 68030 16mhz accelerator for a Mac plus computer for $100. I called the manufactorer of the accelerator and he told me that this upgrade sits on top of the
Motorolla 68000 of the Mac plus or SE. Now I was wondering maybe we can use this device to Mac our
64 pin 68000 ST in 030 machines for only $100. Ant comments could be glady appreciated.

I just want to remind you all that software piracy is the #1 software seller in the world. Many products would not have achieved the number of units sold they have had it not been for pirates spreading copies thus giving people access to the software and making them buy the software to console their consciences.

I myself have over the years seen a number of pirated programs. I've looked at them, and then either I've bought them or I've deleted them. And I'm not alone.

Then there are those who will use a pirated copy themselves, but persuade their boss to buy a couple of copies for their businesses.

This is not meant to say that software piracy is okay. I just want you to think before you post.

Roger Sheppard. (sheppard_r@ix.wcc.govt.nz) wrote:

: How can I monitor what a Shell is sending to a PRG/TTP program,
: are there any utils to capture this..??

On occasions, I used a program that would simply print out its arguments,
then quit to find out about such questions. Something like

```
#include <stdio.h>

int main(int argc, char **argv)
{
int i;

printf("a shell said to me:\n");
for (i = 1; i < argc; i++)
printf("#%d: %s\n", i, argv[i]);
return (0);
}
```

Once you have such a thing, you can always rename it to the program
in question to see what argument that program receives. Of course,
before renaming that dummy to some real program, make a copy of the
real program...

This is the most pathetic excuse for pirating that I have ever heard.
Piracy sells so much software that software houses are creating their own
pirate distribution BBS's. Think of what you write before you write it.

: I myself have over the years seen a number of pirated programs. I've looked
: at them, and then either I've bought them or I've deleted them. And I'm not

I have fould a big problem when replacing LZH201L with
Christian Grunenberg version..

There is a unlisted feature (I think) of setting the base
page with LZH201L, this does not work at all with LZH222-3101..

This is a compatibilty problem...

This is how LZH201l treats -r recursive directories...

Please note the use of the SPACE character..!!

:\dum1\dum2\ *.*

Archives all files in dum2 and adds no folder paths,
of dum1 and dum2 but adds all files and folders/paths to the right
of *.*, ie, tree..

:\dum1\ *.*

Archives all files in dum1, but not the dum1 folder but adds all
files and folders/paths to the right of *.* , ie, tree..

:\dum1\dum2*.*

Archives all files in dum2 and includes both folder paths,
and adds all files folders/paths to the right of *.*, ie, tree..

:\dum1*.*

Archives all files and folders/paths in the dum1 and adds
all files folders/paths to the right of the *.*, ie, tree..

I have sent this info/problem to Christian Grunenberg at

Christian_Grunenberg@S2.maus.de

But I don't know if he is still involved with LZH....

Atari working on Unix and with PowerPCs? Nice joke. They once had their Unix
for the TT and weren't able or willing to go onto the market with it. Why
hould they try it a second time? And if they did, why should anybody be
interested in this? Atari has dropped quite a lot of projects in the past
and I don't see how users can trust a company where dropping projects is the
normal way of doing business. For Unix you need substantial support and
Atari is not in the position to guarantee this.

The extra time is negligable for archives that large. And of course you can look into them. Try unzip -v gmn19999.tos on a Unix box.

Without cache-RAM for the processor you will have no speed increase at
all. Buy yourself a accelerator card like Hypercahe (works great).

: : access to the software and making them buy the software to console their
: : consciences.
:
: This is the most pathetic excuse for pirating that I have ever heard.
: Piracy sells so much software that software houses are creating their own
: pirate distribution BBS's. Think of what you write before you write it.
I somewhat ageree here.

: : I myself have over the years seen a number of pirated programs. I've looked
: : at them, and then either I've bought them or I've deleted them. And I'm not
: : alone.
:
: Right. Instead of just using this pirated software that's already
: installed in my computer, I'm going to delete it, spend $200 on an
: original, and reinstall it. Makes perfect sense.
Well, it might not make sense to you, but it makes perfect sense to me.
Over the years I bought A LOT of software, but ONLY ONCE before I tried
it. I can proudly say that there is NO pirated program on my harddrive.
Does it mean that I will never use 'pirated' software again? I don't
think so. As soon as I need something else - maybe Atari works? - I will
make sure to get a trial copy first. You might call that piracy, but I
call it common sense.

: : This is not meant to say that software piracy is okay. I just want you to
: : think before you post.
:
: Oh, yeah. Good idea, think before you post.

I didn't want to get into this, but ... I know that there are a lot of people
out there who pirate stuff - although I wouldn't say that ST users are any worse
than other PC users. That doesn't mean that everyone who ever used an illegal
copy is a bad guy (not by MY deffinition anyway).Bad are the people wwho get
a program to 'try out' and the 'forget' to buy the program. Is spending $$$ on
a program you already have easy? Not allways, but _I_ do it, and I KNOW of other
people who also do it.

Just my 2 yen.

PS:you are wellkome to look at my harddrive anytime. you'll NEVER find any
pirated programs anywhere else than in the 'evaluate' diractory, and SELDOM for
more than two months(sometimes I am busy so I don't get a chance to try

them out)

From: osantiag@fiji.gesd
Message-ID: <31ofnm$9sq@cnn.MOTOWN.GE.COM>
Source record: 31177

Hey I was wondering if anyone out there has an extensive knowledge of adding a 68030 cpu to the 68000 st's. I saw in a Tiger Macintosh computer catalog a 68030 16mhz accelerator for a Mac plus computer for $100. I called the manufactorer of the accelerator and he told me that this upgrade sits on top of the 64 pin Motorolla 68000 of the Mac plus or SE. Now I was wondering would it be possible that we can use this Mac device on our
64 pin 68000 ST so that our machines can be 030 machines for only $100. Any comments could be glady appreciated.

Orlando Santiago
osantiag@motown.ge.com

P.S. I also heard about the PAK but I could also use more info this $100 accelerator sounds like it could work.

_If_ you know which archiver was used to create it. Before you told us,
how would the user have known that this was a self-extracting zip
archive as opposed to, say, an AFX archive or something more exotic?
With a non-self-extracting archive, you can tell from the filename.

4155. questions about MacMiNT, especially concerning the use of pipe(), fork(), etc.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-03 18:03:04 UTC
From: harbaugh@fcs260c.ncifcrf.gov
Message-ID: <Ctz0t4.B98@ncifcrf.gov>
Source record: 31184

Hello!

I recently downloaded and installed the latest version of MacMiNT, and I
am generally very pleased with the functionality it provides for basic UNIX-like
processing. However, I am having a few problems getting some simple IPC programs
(using pipe(), fork(), etc.) to work properly under mint. Here is an example
of the main() routine taken from Stevens' Advanced Unix Programming
book:

```
main()
{
int childpid, pipe1[2], pipe2[2];

if (pipe(pipe1) < 0 || pipe(pipe2) < 0)
err_sys("can't create pipes");

if ( (childpid = fork()) < 0) {
err_sys("can't fork");

} else if (childpid > 0) { /* parent */
close(pipe1[0]);
close(pipe2[1]);

client(pipe2[0], pipe1[1]);

while (wait((int *) 0) != childpid) /* wait for child */
;

close(pipe1[1]);
close(pipe2[0]);
exit(0);
} else { /* child */
close(pipe1[1]);
close(pipe2[0]);

server(pipe1[0], pipe2[1]);

close(pipe1[0]);
close(pipe2[1]);
exit(0);
}
}
```

The program compiles under gcc, but the childpid returned is ALWAYS 0.

My question is this: can this style of ipc programming be done in MacMiNT?
If so, could someone send me an example (*WITH* a Makefile)?

BTW, Is there a FAQ for MacMiNT? I am somewhat confused about the purpose of some items that came with MacMiNT. For instance, how do I make use of the items in the /mac directory? Do items such as oconv provide the same functionality that they do under MPW? How do I make use of libmac.olb?

Thanks for any information.

: people who also do it.

I understand your point about trying the software before you buy it. This
is a problem with incompatibilities and hidden bugs. One solution is
Shareware, I have 15 registered applications. But what it finally comes
down to is that you have to do your homework. This requires reading
reviews, talking to dealers and other users who have used the program.
My dealer usually has a copy installed on one of the demos to test.
This isn't as easy as grabbing a pirated version from a friend but
honesty is not for the lazy.

If you are in any way associated with pirated software, you are a
pirate. This is a harsh view but it's what I believe. People who use
illegal drugs are as guilty as the dealers. If you take away the demand,
you take away the supply.

Please don't use the excuse that everyone is doing it. The last time I
got away with that was when I was 7. :)

Even if it did work (The Mac is clocked at 7.3 MHz while the ST is at
8 MHz), I wouldn't think the performance would be that much better
than getting a 16 MHz 68000 AdSpeed ST which, the last I heard, ICD
sells for $100.

I realize this has been discussed before, but I hope everyone will indulge me a little. I have a XT/AT keyboard with a built in 3 button trackball that I want to use with a Mega & a MegaSTE & a 386 [all going into one tower]. I have a DEKA to take care of the keyboard stuff, but the trackball is a serial device, and I am trying to find an easy way to use it on the TOS boxes. I intend to use a switch box to be able to only have one keyboard [and one monitor - eventually]. I asked at a [formerly] Atari dealer, and was told I needed a serial->bus adapter, but it only looks like it moves the wires around, and my understanding is that I would need more than that. Does anyone have any thoughts or definite suggestions? The idea of useing a GEMulator type of card doesd not suit me at all, and I would like a solution that would allow me to just use a bit of the space in the switch box, if possible. I would use a serial driver from CyberCube, but I dont want to tie up the serial p[ort on the MegaST.
adTHANKSvance Jon

Here's a plea from a non-networked Falcon user with too
much money....

Steeeeeeeeve could you stick this on an Atari (preferably
Falcon) Usenet group pleeeeeease. Thanks etc.

I have an Atari Falcon with SCSI hard drive and I would like
to plug in a SCSI CD-ROM drive. Does anyone know if I need a
special driver or something, and if so how do I get hold of it.

I have found a PD driver called CDROMM2.XFS which is
described as being Atari's CDROM driver and it has
instructions on how to use it with MiNT. I don't have MiNT
and thus don't have a clue what to do with it or if it will
work.

P.S. Which of the Atari CD-ROMs are best?

I didn't know they had a fix - is it ftp-able from anywhere? IIRC
either Let 'em Fly or WinX had a possible fix built-in, but since I
use neither at the moment... :-)

Well, this is not completely true. Most self-extracting archives on the
Atari though are either based on ZIP archives or LZH archives. Both
STZIP and LHarc allow you to load and treat them just like any other
type of archive.

Cheers,
John

Call System Solutions in the UK. They have a complete Apple CD300 based solution inc. driver, cables and so on. Plug and play! About 300GBP I believe whichlooks bad but if you add the cable price, driver software etc. into the equation, it isn't too bad. They also sell various Atari specific CDROMs.

Binary Sounds
ANNOUNCES !!!
We have taken over the marketing and distribution and support of The
MidiTrack ST Series (Smpte/Edit/EasyTrack), GenEdit, EZ-Score and MidiMaze
of Hybrid-Arts Fame. Stefan Daystrom will continue support and upgrading
of the MidiTrack ST Sequencers. We are also lowering prices to make
our products some of the best values for the amateur, semi-pro and
pro musician!

List prices are as follows , in addition we are offering special
pricing thru Oct-31-1994 as an incentive to get to know us.Demo's
will be available on Genie, Delphi and Compuserve as well as the
Midiworld BBS and other fine BBS's in your neighborhood!

SmpteTrack Platinum 7.1 W/SMPTEmate Plus...To be announced Soon!

EditTrack Platinum 7.1...List $149.95...Special $ 99.95

EditTrack/SmpteTrack Upgrades to Platinum 7.1 (software and manuals only)
From Gold 6.xx ....List $ 70.00
From before 6.xx.........List $ 95.00

EditTrack Gold...........List $ 89.95...Special $ 59.95

EasyTrack................List $ 24.95...Special $ 19.95

GenEdit 2.0..............List $124.95...Special $ 99.95

EZ-Score Plus............To be Announced Soon!!

MidiMaze.................List $ 24.95...Special $ 19.95...2 for $35.00

All prices are in U.S. Dollars plus shipping and handling.

For all those Platinum user who received Gold Manuals with addendums
we now have Platinum Manuals available for $18.95 plus shipping.

Binary Sounds is operated by:
Rick Ladage and Bob Semaan in Houston, TX. USA
We can be reach by E-mail or snailmail or tele or fax!

>reviews, talking to dealers and other users who have used the program.
>My dealer usually has a copy installed on one of the demos to test.
>This isn't as easy as grabbing a pirated version from a friend but
>honesty is not for the lazy.

It's not as easy as you make it sounds like, when you talk about homework.
1. Many people can't get that kind of information, (like me).
2. rewiews doesn't say enough about a program. It may have been tested on
a machine with Tos xxxsomethingxxx and with other equipment, but not
your equipment. As an sysop i have seen MANY programs running on one
machine, but fail to run on others. This happens to commercial stuff as
well as shareware stuff.

It's a matter of money both for the developer and the users. The user is
seaking some kind of quarrantee for the software will work on his equipment.
If/when the developer can't give this quarantee, the user is left back on
his own, and has to seak his quarantee on other fields, or he'll have
to avoid the software, which will bring no money for the developer either.

So bottom line is, unless the developers take their act together, (i know i'm
beeing harsh now), and give that quarantee, the pirate will continue to
grow, just like the demand for the users.

This is the only kind of pirate i can accept. The other is the one who just
simply refuse to pay, and this is not acceptable.

John

4181. Modify file date stamp?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-04 16:49:01 UTC
From: cordes@ac.dal.ca
Message-ID: <1994Aug4.134901.26372@dal1>
Source record: 31063

A member of my user group is looking for a utility which would enable batch modifying of the creation date stamp on groups of files. Apparently a glitch occurred in some clock setting device he's using and many megabytes of files were copied (to a floptical, I think) with the incorrect year in the date stamp.

If it were only a handful of files involved we could go in with a sector editor and modify the file creation date word in the directory structure, but this is not practical in the circumstances. My programming abilities don't feel up to messing at that level on a disk. Has anyone ever encountered a disk utility which would be able to modify the date stamp on groups of files? I know that 'touch' is available, but that would not be appropriate in this situation (it would lose the old month/day information).

Thanks very much for any info,
John

4182. Help with Dead Atari SH HarDrive

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-04 17:49:16 UTC
From: matt@xenon.cchem.berkeley.edu
Message-ID: <31r9ms$bnl@agate.berkeley.edu>
Source record: 31065

I have an old STfm with 2.5 M of memory, and I recently inherited an old Atari SH Hard Drive sub system, but I am having problems with it.

It is one of the MFM variety with a 20M Tandon and I believe a 60M MiniScribe.

I hooked it up to my computer, and turned it all on properly, and booted it up off floppy, and no drive C. I then get AHDI6061 from atari.archive and put that in that AUTO folder of a disk, and nothing again.

Is there anything I can do to see what is dead? I have checked for loose cables and there aren't any. The drives spin up properly, so that isn't the problem.

I would appreciate any help. I am hoping to save this beast because it fills an important niche in my computer use needs.

This is an abreviation for tar.gz, which stands for a tar file that has
been compressed with GNUzip. The 8+3 naming format does not allow .tar.gz
to be used, obviously.

4187. REALLY speedy VGA monitor! (very strange!)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-04 20:50:12 UTC
From: cs93294@assn030.cs.ualberta.ca
Message-ID: <31rka4$rgi@scapa.cs.ualberta.ca>
Source record: 31061

Hi guys, I have a strange dilemma.

I'm using a falcon030 with a PanaSync C1381i. This monitor is really nice, I beleive it is technically a multisync, not a vga monitor. But, I am experiencing some strange phenomena with it. Things that run on this monitor (in particular- games, demos, and music trackers) seem to be running TWICE as fast as they do on other vga monitors! I recently compared the speed of the knockout demo running on my system to another falcon030 with an "ultra-vga" (built in overscan), and mine was running twice as fast! I used to think that this problem was because it was a VGA, but it seems to be faster than the VGA's too, not just the RGB monitors.

It has a 30kHz to 38kHz continuous Horizontal sync rate, and a 50Hz to 90Hz continuous Vertical Sync rate.

Can anyone tell me why things are so speedy?? I DIDN'T upgrade my computer.

I also seem to get "mouse trails" when I try to use the falcon version of protracker (the one that's supposed to work with a vga monitor)!

P.S. Llamatron really goes FFFFffaaaasssstttt!!

>>ICD harddisk driver (I have been told that it is sufficient to turn of the I
>>cache).

I seem to have missed the original of this message, but would be very interested in hearing some more about Outside on the PAK. I'm planning to use the ICD drivers so a possitive test would be *very* much appreciated.

Also How much memory do you have, and have you tried MiNT and/or GCC in it?

I'm *seriously* considering a PAK3 for my MSTE, but want to be sure of the Outside aspect before I buy. Mainly because I want Virtual Memory as well as speed.

Finally when you say the HDDRIVER is supplied, is it on the install disk or what?

Thanks

Roland.

>Even if it did work (The Mac is clocked at 7.3 MHz while the ST is at
>8 MHz), I wouldn't think the performance would be that much better

Also most of the advantages will require at least TOS 2.06 (TT RAM) or 3.06
(Virtual Memory). Many programs will also break.

If you are going to go the 030 route, than a PAK would be the better bet.
Its the one I'm planning to buy.

:-)

Roland.

You're not alone here... (Frankly, I thought MINE was the only Falcon with thgis problem, since my neighbor's does not behave this way nor does the one at work.) I've only found ONE protracker player that behaves properly on my Falcon, although they ALL _play_ properly, and that's the FALCPLAY.TTP program which, obviously, doesn't use the mouse at all.

I thought perhaps it was because of the EagleSonic 32MHz kit I installed in my machine, but even at 16MHz it still has the same problem with mouse droppings.

I'm looking for a multisync monitor.
Someone has what he called 'the latest 3V 15 inch"
He paid $500 new and it's a month old will it work on
an STe and what is it worth?

I know a NEC 3D works, is $250 a good price?
Will a NEC Multisync II work, Is it worth $175?
What is a good price for a NEC 3D?

What other monitors can I use to get all 3 rez's on one monitor,
and used prices.

Thanks,
Thomas

>specific CDROMs.

Maybe I have this backwards, but last time I looked, I seem to remember the dollar (US) was worth roughly 0.6GBP, which puts the System Solutions' Apple CD300 kit at about $500. Now, here in the US, the CD300 (alone) sells for $199, which means you're paying $300 for driver, cables, "and so on." Does their kit come with software, speakers, microphone, and the like? Or am just totally confused here?

Sam McGee (sammcgee@crl.com) wrote:

: I understand your point about trying the software before you buy it. This
: is a problem with incompatibilities and hidden bugs. One solution is
: Shareware, I have 15 registered applications. But what it finally comes
: down to is that you have to do your homework. This requires reading
: reviews, talking to dealers and other users who have used the program.
: My dealer usually has a copy installed on one of the demos to test.
: This isn't as easy as grabbing a pirated version from a friend but
: honesty is not for the lazy.
'Doing ones homework' is easy if 'one' is located somewhere where
there is some kind of local support. When you are like me, here today,
in Thailand tomorrow, that is a bit of a problem.
: If you are in any way associated with pirated software, you are a
: pirate. This is a harsh view but it's what I believe. People who use
: illegal drugs are as guilty as the dealers. If you take away the demand,
: you take away the supply.
I guess that if we were to use your deffinition I am a pirate.

: Please don't use the excuse that everyone is doing it. The last time I
: got away with that was when I was 7. :)
I wouldn't use that as an excuse. As my father told me when I was 5,
"would YOU jump of a bridge if everyone else did"?

The point I am trying to make, is that some people, perhaps VERy FEW, chose
to 'pirate' software - by YOUR deffinition of pirating - for reasons that
_I_ consider legitimate. Shareware IS GREAT, but.....When was the last time
you saw a shareware DTP package of the Calamus SL calibre. (I just recently
bought SL after using a 'pirated' version, WITH MANUALS, for a couple months.

Look, I am not trying to justify the actions of real pirates, but there are
a lot of people out there who use pirated programs for only a short time, and
only to evaluate the package.

PS: I am just speculating on this, but, would it not make sense that if
we had a slightly looser definition of piracy less people would be tempted to
become real pirates. I can see some poor misguided person thinking, " I
don't think I am a pirate, but they do. So, I might as well use this 'free'
program." Although _I_ think that this kind of thinking sucks, I can imagine
people thinking that way, no?

I'm sure that STZip can read it's self-extracting archives, and I think
it can rewrite them as well. I thought LHArc did this as well?
The header added by STZip is pretty small.

> Furthermore, they don't profit from new packer/depacker versions. If I

Ummm... Okay, you've got a point :-). But as long as they're
readable anyway, no probs.

The only problem is working out _what_ they were packed with.

Kim Andersen (Kim@dksoft.ping.dk) wrote:

: It's a matter of money both for the developer and the users. The user is
: seaking some kind of quarrantee for the software will work on his equipment.
: If/when the developer can't give this quarantee, the user is left back on
: his own, and has to seak his quarantee on other fields, or he'll have
: to avoid the software, which will bring no money for the developer either.

: So bottom line is, unless the developers take their act together, (i know i'm
: beeing harsh now), and give that quarantee, the pirate will continue to
: grow, just like the demand for the users.

The guarantee you speak of is unreasonable. It would allow consumers to demand that programmers create custom applications for each user. For example, if you didn't like a certain keyboard shortcut you would want your money back.

What exactly a program does for you is highly subjective. A word processor created in 1985 for the ST would be considered garbage today. But it was leaps and bounds ahead of most packages for the 8-bit. A program isn't a stagnant list of code but a growing project, which increases in power and productivity with each new version. Only will there be a new version if there's a profit to sell them. How much profit is made of each pirated copy, I'd say none.

Well, there's one developer that doesn't have to worry about their new software showing up on a pirate BBS. It seems like a high price to pay but Codehead finally beat all you pirates. The tumor is removed but the patient has died.

: This is the only kind of pirate i can accept. The other is the one who just
: simply refuse to pay, and this is not acceptable.

You cannot be a selective pirate. You either are a pirate or you don't use pirated software.

From: sammcgee@crl.com
Message-ID: <31sh10$2c3@crl5.crl.com>
Source record: 31070

It seems like the British are always getting screwed when it comes to price but all the great Atari hardware is there.

The NEC 3xp triple speed portable CD-ROM drive is about $400 here.
Apple double speed drives are less than $200.
I've seen single speed cheapos (still SCSI) for $80.

Sam

4197. Falcon development docs

Newsgroup: comp.sys.atari.st.tech

From: atwareck@novice.uwaterloo.ca
Message-ID: <Cu1rn1.8yt@watserv2.uwaterloo.ca>
Source record: 30943

Is there any documentation publicly available for the Falcon? I have not
been very successful talking to anybody at Atari, and I am hesitant to
purchase the $80 dev kit (I don't even know what's in it).

I am looking for both a software reference (new bios/xbios calls), as well
as hardware documentation (all h/w chips, dsp communication, etc)

Thanks!

<sigh>

I could hope.

The fascinating aspect of UNIX is that it has support from sources beyond the normal first and third party. There are numerous sites where one can get software and support.

But you are correct, there would be a need for _GOOD_ tech. support if they want to sell it to anyone beyond self-taught hackers like ourselves.

I work as tech. support and network administrator and I would _NOT_ purchase software unless it has support or is trivial enough to do without it.

4199. Falcon SCSI problems

4200. Falcon Queries

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-05 08:55:33 UTC
From: msh@mserv1.dl.ac.uk
Message-ID: <31suq5$sm4@mserv1.dl.ac.uk>
Source record: 31079

Can anyone help me with a few little problems I'm having with my Falcon. I own a 4MB Falcon with 127Mb Hard Disk and TOS 4.04. The problem is sometimes when I reset my computer it doesn't come back on. The power is on and there is sometimes a quick drive access but no picture and the system doesn't try to boot. I have tried turning the power off for different durations and disconecting everthing bar the power cable, but it still doesn't clear the problem.

Normally after a lot of resets and power offs the machine comes back up. Some times it looks like it is working but locks when drawing the windows, other times it draws the windows but locks when you try to move the mouse.

Normally once the error has cleared operation is fine. I don't know what has triggered this, but I've owned my Falcon for around 10 months with no problems until now. I have tested it with GemBench and Systools and all seems fine. I have tried virus killers but I can't find one that recognizes the Falcon (Does anyone know if there is one?)

I would really appreciate help from anyone out there. I think the Falcon is great I just wish this problem hadn't occured.

PS. Does anyone know when ChromaStudio 24 is out, for how much and where from? I'm dying to get this program but all I ever hear is that the release date has been put back. Help please!!!

Thanks for any help

Mark msh@dl.ac.uk

You have forgottoen Apple's $ -> GBP exchange rate is 1.0 :-(which
means that the drive itself costs 199GBP, and SS are charging about
100GBP for the cables, software and service. No speakers (IIRC).

i.e. problems with reset on the falcon.

This could be a recurrence of one of the oldest atari problems around.
Your TOS chip may be loose. Sounds funny but the same thing happens to my
falcon from time to time after hauling it around the country. I don't have the
exact same symptoms, but I do have similar problems with formatting disks.
Half way through the format the machine locks up and I have to reboot. If you
have a store locally take it in and have them open it up and push the TOS chip
back in. It's fairly easy to locate, although alot smaller than the old ones.
Do not do the old 6 inch fix. Even if you didn't have an internal hard drive
this would still be pretty stupid with the daughter board setup on the Falcon.
It could also be that the ram daughter board has loosened up. This might cause
a similar problem. So have it opened up and everything pressed down.

Sounds crazy, but I bet one of these is the problem.

It won't change a file's date stamp. To set one to the current
date, use Multifile's "Touch" command, and to REALLY re-set one,
use DATEFILE.PRG, which has a clunky interface, but does the job.
I believe it's PD.

SP> I have an Atari Falcon with SCSI hard drive and I would like
SP> to plug in a SCSI CD-ROM drive. Does anyone know if I need a
SP> special driver or something, and if so how do I get hold of it.

Steve Pope:

There's a couple of CD-ROM drivers available from Canada that
will work WITHOUT MinT. Let me see if I can find the press releases:

Anodyne Software announces:

ExtenDOS v1.20: multisession and more

ExtenDOS is an extension to Atari TOS to provide CD-ROM
support. ExtenDOS version 1.20, like previous versions, allows
you to access any ISO9660 or High Sierra format CD-ROM as
if it were a removable hard disk. You can switch between
supported disk formats without a reboot, and access files
of any size. ExtenDOS even provides a builtin configurable
cache facility to speed up data accesses.

Now, ExtenDOS v1.20 offers support for multisession photoCD
(on appropriate drives), and for several popular multitasking
environments, including MultiTOS, Mag!X, and Geneva.

Hardware requirements

ExtenDOS v1.20 requires a SCSI CD-ROM drive connected directly to
a SCSI port, or connected to an ACSI port via an ICD AdSCSI (or
equivalent) host adapter. ExtenDOS v1.20 runs on all TOS-based
Atari systems, including the ST, STe, Mega, TT, and Falcon.
Supported functions depend on the type of drive:

Function Type of drive
-------- -------------
read standard CD-ROMs Any
read single-session photoCD Most current drives
read multisession photoCD Selected drives, including the
NEC 74-1/84-1 and the Toshiba 3401

For the latest information on supported drives, please contact
Anodyne Software via GEnie (R.BURROWS1), or via the Internet
(r.burrows1@genie.geis.com), or write to the address below.

Availability

ExtenDOS v1.20 is available now, at a suggested retail price of $29.95. Order from your local Atari dealer, or directly from:

Anodyne Software
6 Cobbler Court
Ottawa
Ontario K1V 0B8
CANADA.

Owners of previous versions of ExtenDOS may upgrade to v1.20 via the free upgrade package which will be available through the GEnie ST libraries. Alternatively, users may upgrade by sending their ExtenDOS master diskette plus $7 (including shipping) to the above address.

When ordering directly from Anodyne Software, please make your payment by cheque or money order, in US$ for shipping to the U.S.A., in Canadian$ for shipping within Canada. Ontario residents please add 8% sales tax.

4208. Falcon Cd-rom

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-05 15:41:00 UTC
From: dan.dreibelbis@f422.n250.z1.tor250.org
Message-ID: <463a307c@f422.n250.z1.tor250.org>
Source record: 31084

To Steve Pope (on getting a CD-ROM drive to work on his Falcon
WITHOUT MinT):

Here's the other press release:

Anodyne Software announces:

ExtenDOS Pro: the complete CD solution

Now you can have your data and audio too! With ExtenDOS Pro,
you can play audio CDs as easily as you can access the data
on CD-ROMs. Put a CD-ROM in your drive, and access it like a
large removable hard disk, or pop in an audio CD and use the
included program to turn your CD-ROM drive into an audio player.

Audio support

ExtenDOS Pro includes the following audio functions:
. play/pause/stop/eject
. track/index forward or back
. skip forward or back
. cd repeat/shuffle.

These are provided through an interface visually similar to a
standard audio CD player, with clearly-marked buttons and a
complete time/track display. If you have more than one attached
CD-ROM drive, you can control each of them individually from
the same easy-to-use control panel.

ExtenDOS Pro conforms to the proposed CD-ROM software interface
standard, simplifying use of CD audio by third-party products.
Further details are available on request from Anodyne Software
at the address below.

Data support

ExtenDOS Pro also satisfies your CD-ROM data needs. You can
access any ISO9660 or High Sierra format CD-ROM as if it were
a removable hard disk, switch between supported disk formats
without a reboot, and access files of any size. It even
provides a built-in configurable cache facility to speed up
data access. And with the right drive, ExtenDOS Pro supports
single-session or multisession photoCD as well.

Hardware requirements

ExtenDOS Pro requires a SCSI CD-ROM drive connected directly to a SCSI port, or connected to an ACSI port via an ICD AdSCSI (or equivalent) host adapter. ExtenDOS Pro runs on all TOS-based Atari systems, including the ST, STe, Mega, TT, and Falcon. Supported functions depend on the type of drive:

Function	Type of drive
read standard CD-ROMs	Any
read single-session photoCD	Most current drives
read multisession photoCD	Selected drives, including the NEC 74-1/84-1 and the Toshiba 3401
audio control/play	Any fully SCSI-2 compatible drive; selected SCSI-1 drives, including models from NEC and Sony

For the latest information on supported drives, please contact Anodyne Software via GEnie (R.BURROWS1), or via the Internet (r.burrows1@genie.geis.com), or write to the address below.

Availability

ExtenDOS Pro will be available beginning 15th August 1994 at a suggested retail price of $39.95. Order from your local Atari dealer, or directly from:

Anodyne Software
6 Cobbler Court
Ottawa
Ontario K1V 0B8
CANADA.

If ordering direct, please make your payment by cheque or money order, in US$ for shipping to the U.S.A., in Canadian$ for shipping within Canada. Ontario residents please add 8% sales tax.

Did you know that the VDI was originally jointly developed by Digital Research and AT&T? From what I hear, this is true, and AT&T even used it for some of their machines.

It seems that VDI was around for a while before GEM came about, and a lot of work and thought was put into it to carefully develop a good graphics standard.

: files with .tgz extension. What are these and how do I extract them?

I am pretty sure they are tared then gziped. The unix extension would
be .tar.gz. Note: gzip is not zip but GNU zip.

```
: Hi
: I have this problem. I made a program in GFA 3,6 (I have a FALCON) and
: when I try to MALLOC a block more than 16384 bytes the program crashes.
: When I tried to debug it I found that the problem is with the MALLOC
: command which cant set aside more than 16384 bytes of memory.
: Does anyone know what is wrong?

When you run GFA, it uses all available memory and leaves 16k outside of
GFA. That is why you only can access 16K with Malloc. A better way, might
be to create an array with the amount of space you need ie 64k = ARR%(16384)
that will hold 64k in memory to access it directly addr%=v:arr%(0)

If you need to use malloc, you must give back all memory you do not need in
GFA. When compiling you use the $mxxxxx xx= number of bytes for GFA to keep
for itself. (YOU DO NOT HAVE TO INCLUDE THE PROGRAM) as GFA handles that.

In interp. mode use the RESERVE command RESERVE xxxx. But use the $m for
you final version.

VInce

Hi
I have this problem. I made a program in GFA 3,6 (I have a FALCON) and
when I try to MALLOC a block more than 16384 bytes the program crashes.
When I tried to debug it I found that the problem is with the MALLOC
command which cant set aside more than 16384 bytes of memory.
Does anyone know what is wrong?

Thanks in advance

You got that wrong. If this keyboard shortcut is well documented, there is
nothing wrong in having it. The user can read all about it. On the other
hand, if the shortcut is documented but isn't working, then we have the
problem.
Thats what i'm talking about. And i'm not going to pay for such an program
and i will not use it either.

>is made of each pirated copy, I'd say none.

Not all programs are continued, and many didn't stop developing because
of piracy, but simply because of profit. An good example is Steinberg's
Pro 24 version III. It was finished allright, but still bug's in it.
Steinberg stopped developing Pro 24 and started Cubase. The first few months
the offered Pro 24 owners cheap updates to Cubase in enchanged for their
Pro 24, but still they had to pay some money.
Steinberg did it once again with Cubase. From version 2 to 3 old users had
to pay once again. Version 2 did also have bug's. They claim you pay for
the new manual, but i'll say it's only a matter of money and profit.

Here is one piece of info about a program that I found some were..

CopyStamp 1.00

A little utility to 'adjust' date and time info associated with a file.
After starting the program the fileselector box appears.
Simply click on a 'from' file and on one or more 'to' files.
Choose 'cancel' to select a new 'from' file, twice to leave the program.

CopyStamp uses fsel_exinput, so GEM >= 1.4.
Freeware without warranty.

The NEC II will work, I use one, dunno about the price as I'm in the UK.

The max res of the NEC II is 800x560 though which is a bit limiting for a
Falcon.

Is it?

From that point of view, the nazis had every right to do what they did in the nazi Germany, because they only followed the law... And it was right to shoot those who tried to get from East-Germany to West-Germany; they were breaking the laws... And so on. Do we have perfect laws today?

I don't think this subject is "black and white" at all.

..And it's far from simple.. What do you think? Do we have to forget all "common sense", when we obey the laws?

It's _very_ easy to say e.g. that hookers are bad people, worse than we are. And it's easy to judge them. But things have many sides - more than many of us ever want to understand... It's easy living to think simply; with strict rules. Life gets much more complex, when we start THINKING: why things are what they are..?! It's so much easier just to obey official and social rules - do as everybody does, with no need to think. And to hate those who don't follow those same rules..

I think, piracy is a very difficult subject; some people have pretty good reasons to behave like they do, but most do not. Copying games, e.g. is very definitely asshole business, harming everyone. But there are other areas of piracy well worth thinking.. Like programs that without their manuals (and often as old versions) serve as demos of those programs. There are programs that nobody wants to buy without good testing first (too expensive, complex, etc.) - and without official or decent demo versions. If someone buys such a program after having a chance to test it before (even illegally)... Can we blame him/her? The law was broken - but nobody was harmed.

That happens, too - no matter what some people say. It's a difficult problem... What we should think about it.

Well, those were just some thoughts - you others may continue, and disagree with me.. Maybe some might even agree.

Tommi

I have had a few replied from some helpfull chap on how to get it running
from my E drive, I managed to get the ACC set up, but could never
get the program set up...

You hold I think the Control Key when you boot the program, this lets you set
the paths, this part works but it does not save the paths....

4238. Falcon Monitors

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-08 08:13:28 UTC
From: msh@mserv1.dl.ac.uk
Message-ID: <324pf8$106@mserv1.dl.ac.uk>
Source record: 30975

Can anyone recommend a good colour monitor for the Falcon? I'm currently using my Falcon on my old Sony Triniton TV and I get a fairly respectable 768 x 560 in colour. However I would like to extend beyond this and still keep use of as many colours as possible. I believe the only way to extend beyond 600 lines is to use a monitor.

I have looked at VGA and SuperVGA monitors but these seem to put restrictions on the number of colours that can be used in the higher resolutions. I am on a fairly tight budget so I would welcome any suggestions for monitors which offer a balance of good value for money and good performance.

Also can anyone recommend which program is the best to expand resolution, "Screenblaster" or "BlowUP". I would be most grateful for any useful information anyone has regarding these matters. Oh, please note I live in the UK so if you could
give prices in pounds I would appreciate it.

Thanks

Mark msh@dl.ac.uk

It's a bit more involved than just changing a crystal,but it can be done fairly easily,cheaply ($2 maybe). I did this on my STFM.

> Without cache-RAM for the processor you will have no speed increase at
> all. Buy yourself a accelerator card like Hypercahe (works great).
>
You will get a speed increase (13% reported by spedomet) & you will notice the difference, but it is true that an accelerator card with cache ram will be
much quicker.

Maybe I will get around to putting the instructions on a.a.u.e soon.

You can buy a CD300 for 150GBP without trying too hard, that's about $250.

Most modern SVGAs are also multisync so anyof those would probably do you. I personally bought a slightly used Taxan 795 multiscan which gives me great picture and performance using Blowup030. I think the rule is use Screenblaster for SVGA/VGA and Blowup for multisyncs although that may change with the new Screenblaster software.
I paid 250GBP for my monitor (list price 500+VAT) and run at 896x768x16 as a rule although I've had 1400x1000 out of it. hard to read! I can also get about 600x400 in truecolor but for most uses, 256 colours will do.
For a potential monitor bargain, mail bubbles@cix.compulink.co.uk, he got me my monitor.

I installed Hard&Soft's CD-Tools over the weekend and so far I'm very happy. A CD-ROM looks just like a hard disc partition, and I was able to control the playing of an audio CD (start, stop, FF, rewind...) and copy audio data direct from an audio CD into a .WAV file. This last trick impresses owners of clowns, most of whom would have to go via analogue to sample a CD. (NOTE: this only works with certain CD-ROM drives).

I haven't tried out the PhotoCD aspects yet, but I see there is a driver for Calamus (and some picture manipulation packages), which opens up some possibilities...

And the bad news: the manual is in German.

Source record: 30976

Here in germany it is just the same - Atari doesn't sell
their developer kit anymore, because Kilwinger is no longer
working for Atari and the got nobody to do the job.
They gave me a phone number in Berlin (I think it was
R.O.M.-Software) were I could buy a DSP-Assembler (Devpac DSP form
HiSoft) and the Atari Compendium. And so did I. The documentation
for the DSP assembler isn't the best - there are no hints how to
programm the Port B and C of the DSP so they work together.

Maybe somebody else (having the DSP56001 manual) could tell
how I can receive/send data through the matrix (sound data -
that's allready working) and receive some small quantities
of data (e.g. for options etc.) on another Port (C) ?

Or could somebody tell the price of the DSP56001 manual from
motorola ?

If you reply please send a Email to me too. Cause I'm on
vacation till October and I don't know when I will have
time to read in this group again, so data may get lost.

Thanx in advance

Alex

Some people may remember I said I was relaying & manufacturing the RSVE
serial accelerator board...

Well, they're here now 8)

The board is designed to sit on top of your MFP (though you can put it
somewhere else instead if you like), and requires you to cut one pin
on the device and solder four wires. I'd put installation in the
'average hobbyist' range. (obviously on a MegaSTe or TT it's not
going to sit on top of the MFP because it's in a different package...)

I'm asking $50 Australian for it, including P&P anywhere in the world.
This also nets you english installation instructions, and includes a
royalty to the original designer.

Please note that I'm hardly covering my costs here - hence the significantly
lower than expected price. I'm not out to make my fortune on this one 8)

If you're interested, send me some mail & arrangements can be made.

mike

PS. If there's some other gizmo like this floating around that you think
would be useful to the ST community, let me know.

To use NVDI to change system font (monaco) the assign.sys file must have
the letter 's' in front of each entry:

s monaco08.fnt
s monaco09.fnt etc.

Make sure that you have NVDI's GDOS switched off (though on my STe it
doesn't make any difference - if Speedo's loaded, the fonts will be
used).

I use speedo 4.1. with NVDI - no probs.!!

The problem isn't with AtariWorks, but SpeedoGDOS. You need
v3.8x to use Warp 9 w/ SpeedoGDOS.

4260. connecting monitor to VCR..

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-09 12:29:27 UTC
From: bbrown@ozspace.brisnet.org.au
Message-ID: <1994Aug9.122927.9885@nntp.brisnet.org.au>
Source record: 30995

O.K. all, I've got one for you. I am currently using an Atari 520 STE with 4 MB RAM, 30 MB HD, and a "Thompson" color monitor. My problem you ask? I would like to use the color monitor with my VCR also. Now when I was back home I used a Thompson monitor with video and audio imputs. I just ran a couple of patch cables between the VCR and the monitor, set the selector switch to the #4 position, and Bob's your uncle! Now I'm here in Australia, Limited funds, another Thompson color monitor, however no video imputs. There is still the 4 position selector switch on the monitor, and a audio line level input, the video input from the computer is through a SCART lead with seperate inputs from the red, green, and blue, from the computer. I tried running the (line level?) output from the VCR into the monitor via the SCART connection, however the best I could obtain was a reverse black & white image. There is also another (IBM?) connector on the back that looks exactly like an Atari joystick connector. Any Ideas? Shotgun maybe <grin>

thanks heaps! bbrown@ozspace.brisnet.org.au

: : when I try to MALLOC a block more than 16384 bytes the program crashes.
: : When I tried to debug it I found that the problem is with the MALLOC
: : command which cant set aside more than 16384 bytes of memory.
: : Does anyone know what is wrong?

: When you run GFA, it uses all available memory and leaves 16k outside of
: GFA. That is why you only can access 16K with Malloc. A better way, might
: be to create an array with the amount of space you need ie 64k = ARR%(16384)
: that will hold 64k in memory to access it directly addr%=v:arr%(0)

You should be aware of the possibility that the location of the array
changes. This can happen if you use DIM or ERASE after determining the
address. I don't think the docs specify anything about the location of
arrays and when they change, but I think if you don't use the commands
mentioned above, you can be reasonably sure that the array's location
will remain the same.

: If you need to use malloc, you must give back all memory you do not need in
: GFA. When compiling you use the $mxxxxx xx= number of bytes for GFA to keep
: for itself. (YOU DO NOT HAVE TO INCLUDE THE PROGRAM) as GFA handles that.

: In interp. mode use the RESERVE command RESERVE xxxx. But use the $m for
: you final version.

If you're developing a program that needs to MALLOC() more than 16K,
the best idea is to issue the RESERVE statement in direct mode, right
after starting up the interpreter. Multiple executions of RESERVE
can cause problems with some newer TOS versions. You should only issue
one RESERVE call per interpreter session, if possible.

4262. Question about animation

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-09 14:10:21 UTC
From: vicb@clark.edu
Message-ID: <3282od$eus@clark.edu>
Source record: 30996
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings,

I have a question regarding animation technique.
The scenario is that of having a single pixel move across the
screen in a straight path, making jumps of about 3-4 pixels between each step.

If I do this with a refresh rate that matches the monitor's speed (50 or 60
Hz, depending on the setting), the movement is very smooth, and it looks like
a single point traversing the screen. However, if I delay each step by
putting in a delay of an extra vertical blank, the same animation looks like
two points are traversing the screen. In summary, the number of vertical
blanks between each step matches the number of points that appear to be
crossing the screen, up to about four or five, at which the eye can
distinguish the jumps. I tested this with an .FLM animation with just one
point moving as well as with a program.

Has anyone else ever experienced this or know why this is the way it looks, or
better yet, any ideas for getting around it? My starfield needs to run at 30
Hz, as the program is sure to need the extra time for other matters.

Any help appreciated,

Victor Bruhn
vicb@clark.edu

I suppose that I am allowed to add that you can get a similar package (incl. multisession support, audio player, installation and diagnostics program) from Hard & Soft, Castrop-Rauxel, Germany for DM 49.90. (99.90 with digital copy of audio data on Toshiba drives).

Can I still get a new copy of Warp 9 from the authors? (Since they
are in limbo). Is it best to just get one from mailorder?
Isn't there supposed to be a new version out soon if they release it?

4265. GCC cross compiler PC->ST or Mac->ST

Newsgroup: comp.sys.atari.st.tech

From: johnk@crl.com
Message-ID: <328nmi$28o@crl5.crl.com>
Source record: 30997

For around 1 year, I was without and ST. Now I have one again, and
I'd like to use it. BUT!

It's a vintage 1986 1040ST with 1MB, a DSDD floppy, and TOS 1.0.
I'd like to use it as a BBS or something :-) But obviously, I
can't bear to program on this particular system, so I need some
kind of cross compiler.

Is there a GCC cross compiler for the PC or a Mac which will produce
executable binaries for the ST? Does it work? I need the whole
shebang: compiler, linker, multi screen source code debugger.

You can still get updates from CodeHead. They're still in business,
they just don't have anybody sitting at the office all day to answer
the phones (which, evidently, didn't ring very often).

Just mail your disk in with the upgrade fee, and wait a week or two
for the new version.

> Is it best to just get one from mailorder?

Since you've already bought and paid for it once, I see no reason to
do so again.

O.K. all, I've got one for you. I am currently using an Atari 520 STE with 4 MB RAM, 30 MB HD, and a "Thompson" color monitor. My problem you ask? I would like to use the color monitor with my VCR also. Now when I was back home I used a Thompson monitor with video and audio imputs. I just ran a couple of patch cables between the VCR and the monitor, set the selector switch to the #4 position, and Bob's your uncle! Now I'm here in Australia, Limited funds, another Thompson color monitor, however no video imputs. There is still the 4 position selector switch on the monitor, and a audio line level input, the video input from the computer is through a SCART lead with seperate inputs from the red, green, and blue, from the computer. I tried running the (line level?) output from the VCR into the monitor via the SCART connection, however the best I could obtain was a reverse black & white image. There is also another (IBM?) connector on the back that looks exactly like an Atari joystick connector. Any Ideas? Shotgun maybe <grin>

thanks heaps! bbrown@ozspace.brisnet.org.au

You may want to obtain MacMiNT from suniams1.statistik.tu-muenchen.de,
directory ~ftp/incoming/MacMiNT. It can run TOS (but not GEM) binaries
on your mac.

Oops--something screwed up--I'll try again. What I did was load all my Speedo fonts and drivers into my GEMSYS folder, where NVDI automatically put its files during the installation. Then I edited the path in the assign.sys file to the GEMSYS folder---also in the extend.sys file. It's essential that NVDI loads before other drivers from the AUTO folder--I put it second after XBOOT. (I'm using MAG!X and an ST). I hope this helps.

4275. SupraDrive: HELP!

Newsgroup: comp.sys.atari.st.tech

Please can anybody help me?

I have just bought a SupraDrive 30Mb hard disk for my STE but the guy who sold it to me did not have the manuals and, worse, some of the utility files on the disk are corrupt :-(

I have replaced the drive with a 45Mb one but I am not able to make it autoboot until I can get fresh copies of two of the programs and their resource files. They are;

SUPRMOD.PRG + SUPRMOD.RSC
and SUPUTIL.PRG + SUPUTIL.RSC

If anyone is able and willing to help, I can arrange for an ftp transfer. Please email me if you have a SupraDrive and a kind heart.

John.

John, just use the control panel to set the date/time back to the
desired moment, use 'touch' to update the stamps on the desired
files, then set the date/time back to now.

That's the easiest way I can think of, with readily available tools.

Or did you want to keep a variety of different months/days, and just
update the year field?

Speedo 4.1 definitely *doesn't* like any comments in assign.sys if
NVDI is around. Also, be careful you haven't got a device ID of 10 in
assign.sys, since this also causes grief.

Less than 40DM. It will not help you how too program that port in a
Falcon. Call Jurek Ceglarek at Atari Benelux and ask him if you coeld
sign a confidential agreement and if you can get the sample disks that
belong by the Falcon toolkit that they don't sell anymore. I'm sure he
will help you.

What do you mean by "it would lose the old month/day information"?
How do you expect to keep that information if you reset it by any
mechanism?

>John, just use the control panel to set the date/time back to the
>desired moment, use 'touch' to update the stamps on the desired
>files, then set the date/time back to now.

At least with GNU touch, you wouldn't have to fiddle with the system
date and/or time, since it has options to set the file date and time
stamp to whatever you want it to be.

Put your 1GB hard drive in a case, with a standard 50 pin SCSI ribbon
cable. Get a Macintoh db25M to SCSI cable and enjoy!!

Brian

I saw a file ,a long time ago, that showed how to
use a multisync on a STe. It showed how to build a
switch to get all resolutions, similar to the one
TOAD sells I'm sure. I got a good deal on a 3D
but don't have enough left for TOAD's switch :(
Anyone able to help me make one my self?
I need the 3D's pinouts and what pins from the
STe need to go where, for all resolutions.

btw, If any one wants I know where a 3D is forsale
for $250, and a Multisync II for $175.

>Thanks for the re-assurance. How about link viruses and the hard drive?

They'll infect any executable file, regardless of what drive it's on, so long as the drive (and possibly the file) aren't write protected. I know on Macs you can prevent some link viruses by locking the programs and their resources. Anyone know if this works on the Atari?
If you own a hard drive, then that should be one of your main reasons for getting an antivirus, esp. one that monitors for possible link virus activity.

> royalty to the original designer.

I am a bit surprised that I never heard of you in the past. No mail,
nothing. Sorry, that I read this article. But I don't remeber that I
gave permission for commercial use of RSVE to you. Yes, I think this
is a commercial useage, not only but too because of the price.

> Please note that I'm hardly covering my costs here - hence the significantly
> lower than expected price. I'm not out to make my fortune on this one 8)

I can't believe that. The price I sell RSVE for is 60DM in Germany, 61DM into
the rest of the world by "slow" mail and 66DM by air mail. I am convinced
that I put a bit more work into RSVE than you. And the price seems me to be
nearly the same as yours.

I'm wondering what your explaination is!

> PS. If there's some other gizmo like this floating around that you think

You may want to obtain MacMiNT from suniams1.statistik.tu-muenchen.de,
directory ~ftp/incoming/MacMiNT. It can run TOS (but not GEM) binaries
on your mac.

And the executables you build with GCC under MacMiNT will work on
your Atari ST, assuming you have a way to transfer files between the
two.

>
> FG has what looks like a capacitor (tiny blue jobby)

D0 and D1 are self-explanatory, HHI and LHI are for the host to tell the drive what density to use (inputs to the drive on pin 2) - inverted and normal. HH0 is an output from the drive to tell the host what the density is (this is the one you want on the Atari. FG is frame ground - strap it to logic ground.

> I'd like to know how to set the drive. I am using it right now as a

>
> The guy I got it from's roommate thinks that it's a special breed of Teac
> that's only low density. (But I don't know how I could tell that)

No, it's the earlier version of the dual density drive, the most common being the FD-235-218HF.

> Now I could use the media hole sensor to drive a 74F157 (commonly used
> for switching 8 & 16mhz lines to the FDC) but I don't know if the drive
> is "switching" densities. Is the only way I can tell to do the mod and see
> what happens?

Yes, you'll need to switch between the 8Mhz and 16Mhz clock's - don't worry about the phase. Use an HC or LS157, no need to go for a fast version, I always use HC logic but correctly going between LS and CMOS, you should use HCT.

You will also have to gate the new HD select with drive-select if you have a B drive and watch the timing, you may need to add a gate or two to get the edges in the right places.

Also be aware that the stupid machine pulses the drive select many times per second as well.

Incedentally the controller that "works" at the 16Mhz clock is the WD1772-02-02 version (although it's only rated for 10Mhz) and I have

been told that VLSI do an equivalent device that also works but I've no part number.

Lastly, don't forget to change the step rate as doubling the clock halves the timing "ticks" and a 3ms step rate becomes a 1.5ms step rate and I've yet to find a drive that will go that fast.

Hope that helps,

Cheers, Martin.

Indeed, the NEC Multisync II, and the 3D, the upgraded version of the II work fine. Others work for Med and Hi res, but low only works on the II and 3D properly. If you use it on a Falcon (like me ;^)), you can easily get 868*600 out of it without flickers ....

I also have manuals for these beasties ;^)

Later,

Karl.

What formats does it play besides standard .MOD files?

I've been looking for a player that will handle .669, .S3M,
and even some .MED files, but no player I've run across
will play them (I have a few players that CLAIM to support
them but then choke to death when I try to load and play
one).

@SUBJECT:Speedup crystal on a ST/E ?? N
I read on this newsgroup about an article in a ST FORMAT to do a crystal change to speed up a ST/E to 12mhz. I have looked in July & August issues, without seeing the article. Could someone give me explicit info on issue date/page # / magazine this was in? Also looking for comments from anyone who has done this or similar mod, I am thinking of doing it to my daughter's STE - can I still run DOUBLE2 with it? Would I get 800x600 in medrez if I did [have a Darius monitor that does 15.75 - 48 mhz] ?? Would it be possible to socket crystals so one could switch between them for problem games etc?
Also, I am still looking for a way to use a AT keyboard with its serial TrackBall on a MegaST without useing the serial port. I have a DEKA for the keyboard, but are there any files/plans/mods to do to use the trackball? Maybe someone has added a second serial port to a MegaST [WITHOUT useing the midi or cart ports ??] ?
Is the MultiBoard shipping ... ie use a ISA Tseng graphics card / TOS 2.06 / + SIMMs [TT ram] through the Mega Buss??
.....adTHANKSvance..... Jon

4308. Help: Pure-C/Curses/Mintlibs

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-13 15:00:47 UTC
From: avesperm@powerup.com.au
Message-ID: <32in6v$51f@grissom.powerup.com.au>
Source record: 31040

I'm using Pure-C, I've got the mintlibs (only PL35, but I'm
getting there :-)) and I'm porting some Un*x based software.

This isn't a problem, I've ported plenty of Un*x stuff before.
The problem is curses. Least year I wrote a _complete_ curses work-a-like
to link in with my code, ported a couple of projects with it: magic.

Unfortunately, that's the point that my system (due to a bizarre
set of problems lost it's HD, _and_ all my backup disks were wiped)...

Is there a Curses that compiles neatly for Pure-C, pref with the
Mintlibs (although that's hardly crucial), that I can plug into this port.
I've got just about everything else fixed up in an evening, and would
rather spare myself the few hours required for a curses rewrite.

4315. Cross compiling with Sozobon C

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-14 21:57:09 UTC
From: gustavo@dent.uchicago.edu
Message-ID: <1994Aug14.215709.17027@midway.uchicago.edu>
Source record: 30895

Hi,
I found a file in archive.umich.edu (sozosun.doc) that supposedly
allows one to patch the sources of Sozobon C to cross-compile on a
Sun. Has anyone succeeded in doing this? Despite my best efforts, I
was not able to get it to work; maybe I was using the wrong release of
the sources. In any case, I would appreciate any tips, suggestions,
etc; I don't really care if the suggestion involves the use of some
PD compiler other than Sozobon. Thanks in advance.

Gustavo

4316. Hype and Viruses..

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-15 00:54:25 UTC
From: sheppard_r@kosmos.wcc.govt.nz

Source record: 30896
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I see there is a lot of rubish being posted about Viruses,
ither from people that have vested intrest in selling Virus Killers
or teenagers that just don't know....

There are NO Keyboard buffer viruses, no Hard Drive boot sector Viruses,
there are some Floppy bootsector viruses, but they are very simple to detect
and fix...

A boot sector Virus is as it states, it installs its self ONLY on boot up,
so checking disks for valid boot sectors is all that is needed, but you must
boot your Atari with out a disk first, or with a know Virus free disk..

Viruses can't write to a write protected disk, its that simple...!!!

With a sector editor, read the boot sector, Track 0 sector 1, check if the
first byte is a 61 and change this to a 00, if this stuffs up the program on
the disk, then change the 00 back to 61.....

Virus check programs wipe the hole boot sector, so be warned, you can't recover
them...

NOTE: most and if not all Boot Sector Virus protection programs are VIRUSES
in them selves, as they will copy them selves to other disks....

When playing (Booting) with unknown floppy disks, Turn of your Hard drive, or
dissable the booting of the hard disk, a Ship program can turn off internal
hard drives...

I have never had major problems with Viruses, and I see no point in spending
money on Virus check programs....

NOTE: The bigest Virus for STE's users is the old DMA chip, it has stuffed up
2 Hard Drives for me....

NOTE: A valid floppy boot sector is when all the bytes add up to 1234 as a sum
check, pad bytes are added at the end of the boot sector to get a valid
boot sector, so changing any byte would make the boot sector invalid...

Just some food for thought....!!!

```
] I see there is a lot of rubish being posted about Viruses,
] ither from people that have vested intrest in selling Virus Killers
] or teenagers that just don't know....

Ahh, it's all age related - I see it so clearly now....

] There are NO Keyboard buffer viruses, no Hard Drive boot sector Viruses,
] there are some Floppy bootsector viruses, but they are very simple to detec
] and fix...

What if you're a computer newbie or don't have the required software?

] A boot sector Virus is as it states, it installs its self ONLY on boot up,
] so checking disks for valid boot sectors is all that is needed, but you mus
] boot your Atari with out a disk first, or with a know Virus free disk..
] Viruses can't write to a write protected disk, its that simple...!!!

Ever tried saving text files to a write-protected disk? Some folks don't
have hard-drives!

BTW, on the subject of "No Hard-Drive Viruses", maybe not, but check this
out (swiped from the UVK documentation)

] Name: Beilstein Virus.
] Type: Reset-proof memory-resident bootsector call virus.
] Discovery date: March 16th 1993 (Volker Shnitz).
] Virus can copy to drive(s): Current floppy drive (A or B).
] Virus attaches itself to: Hdv_bpb, Vbl_queue, Hdv_rw, Hdv_boot,
] Gemdos, Xbios, regularly reset-resistant AND undocumented reset-
] resistant.
] Disks can be immunized against it: No.
] Immunizable with UVK: No.
] What can happen, and when: 1) It can delete specific files when
] these are loaded by the user. These files are 'SAGROTAN', 'MDISK',
] 'FCOPYIII', 'FCOPY3??', 'DISKUS', 'DISKDEMO', 'TED_???' and
] 'G_COPY', 2) It can clear partition "C" of your hard disk when the
] virus in memory discovers that you are trying to trace it (trace
] bit set, for example in a debugger), 3) It can create garbage on
] your screen, 4) Keyboard, mouse and joystick can be disabled, 5)
] Mouse movements can be inverted (like with the "Ghost Virus"), 6)
] Printer output can be corrupted, 7) Modem output can be corrupted,
] 8) A bomb error can be created, 9) The system can be frozen until
] you enter the password "Apokalypse", 10) Memory can be cleared,
] followed by a reset, 11) The first hundred sectors of a floppy
] disk can be cleared, and 12) It can delete a folder. These are
```

] quite an amount of things that can go wrong!

Harmless for hard-drives!? I think not!

] With a sector editor, read the boot sector, Track 0 sector 1, check if the
] first byte is a 61 and change this to a 00, if this stuffs up the program o
] the disk, then change the 00 back to 61.....

Again - what if folks don't have the required software/know-how!?

] NOTE: most and if not all Boot Sector Virus protection programs are VIRUSES
] in them selves, as they will copy them selves to other disks....

AFAIK only ONE anti-virus copies itself, which is the one that displays
the "This virus will flash the screen if it detects an executable boot-
sector, you can remove this virus by pressing reset". There are 3 versions
of this virus. A non-copying one, a copying english version, and a
copying german version. Both copying versions will _not_ overwrite
executable boot-sectors however!

] I have never had major problems with Viruses, and I see no point in spendin
] money on Virus check programs....

So you don't know what kind of annoyances they are, and what damage they
can do!

] NOTE: A valid floppy boot sector is when all the bytes add up to 1234 as a
] check, pad bytes are added at the end of the boot sector to get a val
] boot sector, so changing any byte would make the boot sector invalid.

Fat lot of use that is to the poor blighter who had his software destroyed
when a virus over-wrote the bootsector booter for it....

Write-protecting every disk isn't practical in many cases. The only decent
way to check for viruses is to download something like V-Killer (v3.84)
and check any new disks recieved. If the disk is supposed to boot, then
fine. If not, then using the "Test Kill" feature will render it non-
executable. If the disk then fails to work, then you can make it executable
again..... Quite a good feature this, basically, if the disk doesn't
need a booter, then clear the boot-sector and perhaps stick the
"Virus Free Disk" bootsector message onto it so you know for sure....

This is NOT an easy thing to do. After YEARS of trying to find the best way to do this, I found that there are only two ways to do that. Either write the TOS program so that it sends the text directly to the program with the window, OR steal the BIOS AND GEMDOS trap vectors and redirect EVERYTHING that has anything to do with console text (BIOS device 2 and all the GEMDOS console calls... GEMDOS does not call BIOS through the trap so you have to do it yourself).

Also, look into the XBRA protocol so other programs don't whine about your vector stealing.

Now, if you're using MultiTOS, it's an entirely different theory. However, I have yet to figure out how to do it. Something to do with Fforce, Fdup, and pipes. I wonder of anyone else can shed some light on this.

Of course, GEMDOS is usign the BIOS traps. You don't want to redirect the traps (again), but redirect the console function pointers (from TOS 1.02 on). That's the most efficient way to do that.

On MiNT or MagiC you might however prefer to set up a pipe and redirect the output to it.

Well, the last time I looked, GEMDOS definitely does do a TRAP #13 on
my computer, though I guess it may vary depending on the TOS version.
Anyway, the easiest way to do this I thought, would be to grab the BIOS
IO routine vectors which are in memory just after the system variables.
This is what the BIOS calls after it decides what device you are using.

Hi All,

Does anyone know where I can get a program for the ST, once sold by Dr T, that Resynthesises midi data ? Apparently it could take S900 sample data and send it to a Kawai K5, amongst other things.

I don't know what it is called, but I *DO* know that it exists.

Can anyone help ?......or if you have ANYTHING for the Kawai K5, PLEASE drop me a line.

Many thanks.

I was hoping a utility might exist which would just modify the 5
bits containing the year info (leaving the bits containing the
month/day info unchanged) in the date stamp in the disk
directory. Apparently there's no such utility around.

4327. Need to Switch drives A & B, quick!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-15 12:21:36 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <32nmkg$oh9@charm.magnus.acs.ohio-state.edu>
Source record: 30903
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Arrghhh! Well, first time I've ever had any problems with Diamond Edge... It seems to have trashed my hard-driver (ICD). No crash or anything like that, it ran fine, but upon restart my machine bombs (3) as soon as it hits the hard drive. Well, no big deal, I've had to reinstall the driver with HDUTILS.PRG before, a simple process, *BUT* (here's the fun part), my drive "A" is dead, I can get to the desktop fine (just ROMS), run ICDBOOT (or whatever that is called) to let TOS know I have something attatched to the SCSI port, and then run HDUTILS all from drive B. *BUT* everything works fine until I get to the critical stage; I've sellected to install the driver on drive "C", and "wham" the killer dialogue pops up "Please insert ICD utilities disk or other disk with 'xxxxxx' in the Auto folder of DRIVE A". Arrgggggghhhhhhh! @#$%^&*^%$#$%^$%^$^&&%#$&^#@!&&*)&%^&$ Nothing I can do will make ICD understand that I have that in drive B. So, I need to switch the drives. Now, I can't physically switch them, because the external drive is an old "Master"(?) drive and the cabling inside is somewhat different. Also, I'm not sure that it is actually drive A that is bad and not the cabling between the drive and the motherboard or powersupply. I understand that, however, it is possible to switch these drives either through software or through a small mod to the motherboard somewhere... Anyone with knowledge of this????

Any help would be greatly appriciated!

Thanks,

>

Ludo says: some multisync VGA's can't handle the knockout demo frequency
set to the VGA port (51 Hz, just above 30KHz as i remember). A friend of
mine ran this demo on his monitor (usual multi, black tinitron) and after
one minute the screen went black and power of monitor went down. After re-
setting it still worked but I don't suppose it was a very healthy thing.
The creators of the demo warned of this with use of normal VGA monitors,
but now you know.. So watch out with your screen! My monitor works fine
though, and as fast as the TV mode it seems to me... (which should'nt be
the case, but anyhow)

I have only one ACC player that playes without the mouse disturbance (due
to the bitmaster's code I thought hearing somewhere), and that is the
32 channel player from MEGAtracker 0.95 (NICE)(ftp.cnam.fr). It doesn't
have the problems described above, but the playback is not so 'clear'. It
seems to murmer (or rustl, whats the word) or better seems to have some
background noice...
(but this could be only my falcon, who knows.. Just try it out and..)

Message-ID: <19940815151753.L.J.Sak@sp0009.kub.nl>
Source record: 30907

Ludo says: I have used protect also, but stopped using it.. It was because the program (at least the version I used) erased executable diskbootsectors or other bootsectors containing information when not write protected. Due to this some of my backup disks lost their 'index'.. Dangerous stuff I think (more evil than a virus). This can happen to games off course, too (if they aare unprotected).. That's it for now..

I use the screenblaster and it works fine to me. This one is the one mostly
supported by other hardware makers (for example FalconSpeed).. The best moni-
tor buy (by my knowledge) would be a multisync VGA, where you can get very
reasonable resolutions and colors. A TV handles more colors at higher reso-
lutions but uses a much lower frequency (and interlaced :)).. This is all
very unhealthy for your eyes (only (joke, that's a movie)).. So swallow less
colors with the resolution and think of your health :)
A VGA multisync is costly, but a normal VGA (without multisync) has much more
restrictions with screen-usage, which the former doesn't have..

> Hard I.

Ludo says: I have Falcon, 4.04, 2*85 MB, 14 Mb, NVDI 2.51 and screenblaster II
and have no problem with speedo (I have 4.21) AND NVDI. Only Atari Works
doensn't print all the time (errors in upper line of screen, should be a
message box but isn't)... As for the system font replacement, I used some
other program to fix that, but I can't remember the name.. Sorry (it was old
though). The config file does only have to contain your gemsys path and
(screen and printer drivers), the rest is not usefull. Speedo does this all
using other *.SYS files.
(unless you still want to use pixelfonts in stead of speedo)

Hopefully helped you,
L.J.Sak@Kub.NL

4335. Which C-compiler to use?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-15 16:12:26 UTC
From: sanders@sci.kun.nl
Message-ID: <CuL3os.xD@sci.kun.nl>
Source record: 30913
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi all,

A recent posting about GCC complained about the almost doubled exec size, compared to Lattice C. Now I know there was a C-compiler-thread some time ago, but I'd like to ask it again: What C-compiler is best to use on an Atari? A few years ago it was Turbo C that won on all points: Fastest compile times, shortest code, fastest code, best help system. So when I decided to have a go at C, I bought Turbo C 2.0, and I'm very pleased with it. Now I thought that GCC (which I use at uni for my programming assignments) was unbeatable with respect to the code it generates, and had only drawbacks concerning memory requirements. Now this story about the large exec size maked me wonder again, what to do if I master C enough to start doing serious work. Should I download GCC and spend a holiday setting it up, should I buy Lattice C (which is quite expensive for a student), or can I keep on using Turbo C? My original dream-world was to use Turbo C for developing, and GCC the final source. Now, in the days of MultiTOS, I can imagine developing with GCC is not that bad anymore, with multiple man-pages on screen, compilation in the background and an editor window, but I am very much against PC-style, unneccesary huge execs.

Help me out, please. What do you use, and why?

Thanks in advance,

--
```
/* sanders@sci.kun.nl */ main(){char*c="2$$,$$2CD$45$$,$$5(D$4%$$,$$%(D$4%J*/K*%(K,K2MMPL%

What PROTECT are you talking about ?

If you are reffering too PROTECT6 it's will NEVER erase a executable boot-sector without asking first, and it displays the boot sector !!

It will write a auto-executing boot-sector on other disks (it's auto-executing because most viruses don't infect auto-booting disks, but the code only does a RTS). The bootsector is also IBM compatible !

If you have an older version - Please get the newest one at once (the old ones doesn't have the link-virus detect code either)

There is an annoying problem using Falcon with a good multisync monitor:
if you try to run games or demos that switch sync rate below normal VGA-
rates you get a blurred picture, as most of the really good multisyncs
cannot display _below_ 50hz! Or the Mhz:s go too low (who knows?)
My 17" MAG (can do 50-120Hz) gives always message "Out of Range", when
trying to run demos that are supposed to run on a VGA-monitor.
The same thing happens for example with NEC-multisyncs. These
monitors are simply too good!

Anyway, you get the ultimate picture quality with a .26 mm multisync,
and it's a pleasure to work with it.

All the Best,

The world's most pervasive and damaging virus is produced by a company
owned by a guy named "Gates" who thinks he's a god of some sort. It's
called DOS, and it comes with a companion program called "Windoze" and
it has now copied itself to hundreds of millions of machines.

And very few people seem to know this obvious Truth...

>NOTE: A valid floppy boot sector is when all the bytes add up to 1234 as a sum
> check, pad bytes are added at the end of the boot sector to get a valid
> boot sector, so changing any byte would make the boot sector invalid...

Note that the 1234 checksum is only necessary for a boot sector that is EXECUTEABLE - therefore changing any byte of an unexecuteable boot sector does NOT invalidate it. Changing a byte on an executeable boot sector will have the effect of making it non-executeable. Anyway its easy enough to change the bytes and recalculate the pad bytes to restore the 1234 checksum.

BUT changing bytes willy-nilly may also mess the disk up - the boot sector contains info re. the disks characteristics (tracks/sectors per track/etc) and if this info does not correspond with the REAL setup then **!"$"!.

Spice can be found at a number of ftp sites

ftp.cs.ruu.nl /misc/spice.zoo
ftp.uni-paderborn.de /anwender/spice.lzh
ftp.uni-stuttgart.de pub/systems/atari/applications/science/spice.lzh

There is also a demo of a graphic front end called Spiceline 1.3 which looks
pretty good. I think there are ordering details in the docs with the demo.

ftp.tu-clausthal.de spicln_e.lzh
src.doc.ic.ac.uk computing/systems/atari/umich/Graphics/spicln_e.lzh
ftp.uni-stuttgart.de pub/systems/atari/applications/science/spicelin.lzh
ftp.uni-paderborn.de /misc/demo/spicline.lzh

After you have un-archived spice, there will be a file called prl.tos
This needs to be run before running spice as it sets up the libraries.

Happy simulating

4346. Fuzzy Picture on my STFM

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-16 11:13:16 UTC
From: kaps3@central.susx.ac.uk
Message-ID: <32q70c$g67@infa.central.susx.ac.uk>
Source record: 30925

My 1040STFM (1.2) has a fuzzy picture, not remedied by twiddling the little screw on the modulator thingie. Though monitor lead, picture is clear, but the white screen on boot up has a flickery dark line across the top.

Occasionally, a couple of pixels in the screen twinkle - like when you make a rubber band box.

Help. Is this cheap to fix?

Thanks.

Steven.

4349. TEAC drive jumpers

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-16 13:48:19 UTC
From: acounis@lpnhp3.in2p3.fr
Message-ID: <32qg33$ocp@ccpnws.in2p3.fr>
Source record: 30928

Hi,
I have a nice TEAC 3"1/4 disk drive and I would like to know the jumpers meaning
They are organized as an array like this:

```
E o o complete ref: TEAC FD-235HF 4240
D o o
C o o
B o o
A o o
2 1
```

For the moment, there are 2 jumpers (AB1 and CD2) and the drive comes from a PC.
Can anyone help me ?
Thank you.

: NOT invalidate it. Changing a byte on an executeable boot
: sector will have the effect
: of making it non-executeable. Anyway its easy enough to change the bytes and
: recalculate the pad bytes to restore the 1234 checksum.

Do you know the algorithm for calculating the bootsector checksum?
I know about the XBIOS function that sets the pad bytes correctly
in a bootsector in memory, but I have never seen any docs describing
the checksum formula used by TOS.

I've been wondering.... is it possible to load more than one resource
file? It would be nice if I could load a main resource file and then
add or remove objects loaded seperately. This would be useful in a
desktop program, because you would not need to edit resouce files
in order to add new icons supplied by new applications (like gemview).

Yes it is possible, but you can't use the AES rsrc_load function, you
have to write your own. There is code for xrsrc_load() etc supplied
with Interface (*The* RCS) which is available from Compo in the UK.
The xrsrc_load function also has the advantage that it can load CICONs
in all AES versions, which is very useful.

The Gemini desktop loads all its icons from a second file, BTW.

: >trap so you have to do it yourself).

: Of course, GEMDOS is usign the BIOS traps. You don't want to redirect
: the traps (again), but redirect the console function pointers (from
: TOS 1.02 on). That's the most efficient way to do that.

Pardon me, but I actually did this and learned the hard way what the GEMDOS concole calls to not call the BIOS through the trap vector. I redirected only the BIOS and found that NONE of the GEMDOS calls were being redirected. I ended up having to do it myself.

I was using TOS 1.02 at the time, and considering Atari's history of having the OS always call other parts of itself directly (ie, even under TOS 4.04, the desktop doesn't call fsel_xinput for the file selector, but calls it directly in ROM), I have no reason to believe that the GEMDOS console functions ever call the BIOS through traps.

: On MiNT or MagiC you might however prefer to set up a pipe and redirect
: the output to it.

Yes. But how do you do this?

4359. What C language should I get?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-16 22:19:46 UTC
From: brunos@mafalda.math.mcgill.ca
Message-ID: <32re22$gfp@homer.cs.mcgill.ca>
Source record: 30845

Hello, I am interested in getting a C language to program Audio applications on my Falcon. I have a few questions about the two main comercial C languages available.
1) How do Pure-C and Lattice C compare in terms of speed (Compiling, execution)?

2) What support programs are included with the two systems? (debuggers RSC editors, optimisers, librairies)?

3) Are they bopth fully up to date as far as (M)TOS, and AES are concerned?

4) finally, do either of them support C++? (I heard Pure C does).

Thats about it. Also, note that I don't really care if there is an english language version available, I could use either English French, or German. (in that order of preference).

Who distributes these programs in Canada?

Thanks for your aopinions.

Bye, Bruno Schmidt

4361. How to Run an ACC from MTOS Desktop?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-17 01:34:16 UTC
From: scotty@cais2.cais.com
Message-ID: <32rpeo$8fr@news.cais.com>
Source record: 30937

Hi!

The MultiTOS manual for the Falcon030 says that you can run an ACCessory
from the desktop just by clicking on it. Wrong!

I added ACC to the extensions in GEMEXT in the GEM.CNF file, and this made
no difference. I was able to run *some* accessories by duplicating the
line in NEWDESK.INF that has #G 03 FF ... *.PRG@ ... on it, and substituting
.ACC for .PRG -- but this doesn't seem right.

Am I missing something obvious? It certainly wasn't in the 12 pages of
"documentation" Atari provided for MTOS! Nor was this elaborated upon in
my (suddenly outdated) Compendium.

Hi,
I don't have my copy of ST Internals to hand, but from memory the drive select lines are the 2 end pins on one side of the sound chip. Check in the book to make sure you have the right side before you head for the board with cutters, wire and a soldering iron, but I did this to an old ST with a 360K internal drive so I could boot off double sided disks. Just swap the pins over and voila (tm alt.hackers :-). Of course, don't do this if you believe in warrantees !!

"Star Trek Lost Episodes" transcript.

<Picard> "Mr. LaForge, have you had any success with your attempts at finding a weakness in the Borg? And Mr. Data, have you been able to access their command pathways?"

<Geordi> "Yes, Captain. In fact, we found the answer by searching through our archives on late Twentieth-century computing technology."

<Geordi presses a key, and a logo appears on the computer screen.>

<Riker looks puzzled.> "What the hell is `Microsoft'?"

<Data turns to answer.> "Allow me to explain. We will send this program, for some reason called `Windows', through the Borg command pathways. Once inside their root command unit, it will begin consuming system resources at an unstoppable rate."

<Picard> "But the Borg have the ability to adapt. Won't they alter their processing systems to increase their storage capacity?"

<Data> "Yes, Captain. But when `Windows' detects this, it creates a new version of itself known as an `upgrade'. The use of resources increases exponentially with each iteration. The Borg will not be able to adapt quickly enough. Eventually all of their processing ability will be taken over and none will be available for their normal operational functions."

<Picard> "Excellent work. This is even better than that `unsolvable geometric shape' idea."

. . . 15 Minutes Later . . .

<Data> "Captain, we have successfully installed the `Windows' in the Borg's command unit. As expected, it immediately consumed 850f all available resources. However, we have not received any confirmation of the expected

`upgrade'."

<Geordi> "Our scanners have picked up an increase in Borg storage and CPU capacity, but we still have no indication of an `upgrade' to compensate for their increase."

<Picard> "Data, scan the history banks again and determine if there is something we have missed."

<Data> "Sir, I believe there is a reason for the failure in the `upgrade'. Appearently the Borg have circumvented that part of the plan by not sending in their registration cards."

<Riker> "Captain, we have no choice. Requesting permission to begin emergency escape sequence 3F ...."

<Geordi, excited> "Wait, Captain! Their CPU capacity has suddenly dropped to 0!"

<Picard> "Data, what does your scanners show?"

<Data, studying displays> "Appearently the Borg have found the internal `Windows' module named `Solitaire', and it has used up all available CPU capacity."

<Picard> "Let's wait and see how long this `Solitaire' can reduce their functionality."

. . . Two Hours Pass . . .

<Riker> "Geordi, what is the status of the Borg?"

<Geordi> "As expected, the Borg are attempting to re-engineer to compensate for increased CPU and storage demands, but each time they successfully increase resources I have setup our closest deep space monitor beacon to transmit more `Windows' modules from something called the `Microsoft Fun-pack'.

<Picard> "How much time will that buy us?"

<Data> "Current Borg solution rates allow me to predicate an interest time span of 6 more hours."

<Geordi> "Captain, another vessel has entered our sector."

<Picard> "Identify."

<Data> "It appears to have markings very similar to the 'Microsoft' logo..."

<Over the speakers> "THIS IS ADMIRAL BILL GATES OF THE MICROSOFT FLAGSHIP _MONOPOLY_. WE HAVE POSITIVE CONFIRMATION OF UNREGISTERED SOFTWARE IN THIS SECTOR. SURREDER ALL ASSETS AND WE CAN AVOID ANY TROUBLE. YOU HAVE 10 SECONDS TO COMPLY."

<Data> "The alien ship has just opened its forward hatches and released thousands of humanoid-shaped objects."

<Picard> "Magnify forward viewer on the alien craft!"

<Riker> "My God, captain! Those are human beings floating straight toward the Borg ship - with no life support suits! How can they survive the tortures of deep space?!"

<Data> "I don't believe that those are humans, sir. If you will look closer I believe you will see that they are carrying something recognized by twenty-first century man as doeskin leather briefcases, and wearing Armani suits."

<Riker and Picard, together - horrified> "Lawyers!!"

<Geordi> "It can't be. All the Lawyers were rounded up and sent hurtling into the sun in 2017 during the Great Awakening."

<Data> "True, but appearently some must have survived."

<Riker> "They have surrounded the Borg ship and are covering it with all types of papers."

<Data> "I believe that is known in ancient venacular as `red tape'. It often proves fatal."

<Riker> "They're tearing the Borg to pieces!"

<Picard> "Turn the monitors off, Data, I cant bear to watch. Even the Borg doesnt deserve such a gruesome death!"

-< End

Well, _I_ thought it was funny! :)

There are several Progs which do things that you want. I only know the name of my program.
TCache has the ability to redirect drives. You are allowed to redirect each drive to
a different drive. It works on bios-level and normally it works fine, but when your
problem has something to do with copyprotection then it might be possible that this trick
doesn't work. TCache is a Cache-prog with several utilities inside an can be found
on ftp.uni-clausthal.de /pub/atari/disktools/cache under the name TC63_TST.TOS. It's selfextracting.

Yes, you're right. I think this was the reason for introducing the
io vectors for console, serial, parallel, etc. in TOS 1.02

>: On MiNT or MagiC you might however prefer to set up a pipe and redirect
>: the output to it.
>
>Yes. But how do you do this?

I haven't got my code and manuals here, but basically you create 2 file
descriptors with Fpipe(?), fork your process and Fforce() the stdout
file descriptors (and stderr) to the writing end of the pipe. Close the
reading end. Then parent then closes the writing end (he only wants to
read the ouput). That's it, you child process can start another process
with Pexec and the parent (your original program) gets the output.

Steve can you forward this to the people:

System Solutions are very much over-priced and there attitude to customers is lazy, patronising, and rude. I am still waiting for a them to return a call to explain why the modification they made to my Falcon doesn't do what I was told it would, cost 40 pounds more than I was quoted and took nearly three weeks to complete a 20 minute job. I have heard of similar problems from other people who have dealt with them.

For these reasons and the fact that ExtenDOS can be bought substantially cheaper direct from Canada I was interested to know if there is another UK outlet that might supply a CD-ROM driver.

4370. HELP!! Lattice 'C' and resource files...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-17 14:44:01 UTC
From: djc90@ecs.soton.ac.uk
Message-ID: <32t7nh$sdn@vermeer.ecs.soton.ac.uk>
Source record: 30849

I have an old (C. '87) Lattice 'C' compiler by MetaComCo (who? I've never heard of them either - all I know is they went bust in 1991) and I've got a serious problem with loading resource files.

The compiler works fine but the compiled programs will load resource files ONLY if they contain just one tree (menu, form, etc).

The system I'm using is a Mega ST2 with an SH205 hard disk.

If anyone has got any clues please contact me.

Thanks, in advance.

Derek Chandler.

There are one or two link viruses though... ^^^^^^^^^^
>there are some Floppy bootsector viruses, but they are very simple to detect
>and fix...

>A boot sector Virus is as it states, it installs its self ONLY on boot up,
>so checking disks for valid boot sectors is all that is needed, but you must
>boot your Atari with out a disk first, or with a know Virus free disk..

Er, there has been one or two viruses that could get round that. Anyway, how
would you know if a disk is virus-free or not if you DON'T have a virus
killer?!?!

>Viruses can't write to a write protected disk, its that simple...!!!

>With a sector editor, read the boot sector, Track 0 sector 1, check if the
>first byte is a 61 and change this to a 00, if this stuffs up the program on
>the disk, then change the 00 back to 61.....

Ha ha! This is a bit risky to say the least! (Clue- don't try this with games
or demos!) Anyway, I thought the hex value for a short branch was $60 not $61...

>Virus check programs wipe the hole boot sector, so be warned, you can't recover
>them...

Well.... They CAN if you want them to, but they generally just READ the
bootsector and check it. Secondly, you CAN recover some bootsectors- with the
help of some virus killers! Guess whos not been using any.... :)

>NOTE: most and if not all Boot Sector Virus protection programs are VIRUSES
> in them selves, as they will copy them selves to other disks....

!!!!!!! Fume! Fume! Fume! !!!!!!!!!!!!

Now, as the writer of a bootsector virus protection program myself, I must
say that this is a load of complete crap, and written by someone who obviously
doesn't know a damn thing about bootsector virus protection programs. Viruses
spread. Viruses copy themselves to other drives. Most virus protection programs
do NOT do this. One or two do this (eg "english/dutch" antivirus) do but MOST,
in fact the VAST MAJORITY, stay resident in memory and either check for an
executable bootsector, or check for reset-resident programs, or in the case

of my Agraboot v2, both! (And it checks for suspicious code as well!)

Oh well, I suppose you know more about what my code does than I do! :):)

>When playing (Booting) with unknown floppy disks, Turn of your Hard drive, or
>dissable the booting of the hard disk, a Ship program can turn off internal
>hard drives...

What? I thought you said there was no hard drive viruses!!! Erm, if you're booting from a floppy, then surely the hard drive doesn't boot up anyway? And if you're booting up from an HD, then bootsector viruses won't be installed anyway since you're not booting from the floppy! Tell me, what sort of strange system do you have in which you simultaneously boot up from the floppy AND HD!

>I have never had major problems with Viruses, and I see no point in spending
>money on Virus check programs....

To be honest, viruses are usually more of a pain than a major headache, but I don't want to be the one with a major headache! I don't really see any big conspiracy between writers of virus killers. Some of the viruses (Most of which are thankfully quite rare) ARE pretty dangerous and are not made up by writers of virus killers.

>NOTE: The bigest Virus for STE's users is the old DMA chip, it has stuffed up
> 2 Hard Drives for me....

That was not a virus- it was a bug.

>NOTE: A valid floppy boot sector is when all the bytes add up to 1234 as a sum
> check, pad bytes are added at the end of the boot sector to get a valid
> boot sector, so changing any byte would make the boot sector invalid...

No, actually, a checksum is stored in bytes 510-511 of the bootsector in order that the values of all the word lengths (NOTE- a word is 2 bytes!) adds up to $1234. (ie 1234 in hexidecimal!) This is needed for a bootsector to be EXECUTABLE not "valid"! (A disk formatted on the desktop has a "valid" bootsector, but it is not executable, and doesn't have a checksum of $1234.) However, a virus has been done (See UVK documentation) that actually work from a non-executable. Again, it's not very well spread, but it does make one think.....

>Just some food for thought....!!!

No offence Roger, but you should have thought a bit more before you embarked on the above tirade.

Michael.

You were on the right track. As well as changing .PRG to .ACC in the line
above, you must also change #G to #A ("#G" means GEM program,
and "#A" means accessory; ordinary TOS doesn't understand #A and will
ignore that line.

>substantially cheaper direct from Canada I was interested to
>know if there is another UK outlet that might supply a CD-ROM

Well I can't say I've had any serious problems with SS, but a couple of other people do do drivers (sortof).

Anybody who sells the ICD Pro utilities - as they have a .XFS driver. Not very good, and requires MiNT of course, but it does sortof work. Most UK Atari dealers do ICD Pro Utilities.

Also COMPO do some sort of Falcon art package which has another .XFS driver in it. Very expensive if you *don't* want the art package. Haven't tried this one myself.

Basically though, its SS. I bought my ICD Pro from them, and so far have had one free upgrade. I friend of mine bought a copy from another very reputable dealer, only to find it was an older copy (6.1.X) and hasn't been offered any sort of upgrade yet. I wont name the dealer as I'm sure its an isolated incidence.

Also SS do Extendados and this is really the only viable option. By all means go direct to Canada (I did for my copy of Audio CD Master 3 - but thats a very long story), but most people want to deal with a local dealer. I'm planning to buy a PAK3 from SS very soon. The've kept me pretty well informed as to the current state of affairs, and really there not a lot of choice. No other dealer does them in the UK, and the thought of sending my MSTE abroad does not appeal to me.

OTOH if you want to talk about bad experiences with dealers, then who remebers Third Coast Technologies ;-) ?

Roland.

****************************************************************
```

Here, GEMDOS is *obviously* using the BIOS trap!
The same is true for TOS 1.04, and I don't see why TOS 1.02 should
behave any differently (I don't have a loadable TOS 1.02 available,
just an ancient set of ROMs somewhere...8-))

(No, I diddn't check if *all* GEMDOS console output functions
use the BIOS trap; but at least one other GEMDOS call, Crawio(),
definitely does so...)

Couldn't there be another explanation for your problem?

For example, what if your BIOS trap handler had a bug that prevented
it from working correctly if called from *Supervisor Mode*?
(You *did* have special case handling for this, didn't you?)
Most user programs run, well, in User Mode, whereas GEMDOS runs
in Supervisor Mode - a bug like this could very well have the effect
you described...

>I was using TOS 1.02 at the time, and considering Atari's history of
>having the OS always call other parts of itself directly (ie, even under
>TOS 4.04, the desktop doesn't call fsel_xinput for the file selector, but
>calls it directly in ROM), I have no reason to believe that the GEMDOS
>console functions ever call the BIOS through traps.

It does. Just get a copy of SysMon and check it yourself.

Hi,

Could someone familiar with the SM124 communicate with me via email? I have a 1987 model that is blowing a fuse located on the vertical piece that stands up from the power supply section. I've replaced the voltage regulator and one of the other power transistors in that area already. I've heard that this fuse blowing (3/4 watt fast blow) is a fairly common occurence. I'm looking for any technical advice I can get.

Thanks,

Bill Jones

A bootsector is executable if the word sum of all 256 words of the
bootsector is 0x1234. E.g. add all words as if they were longs (clear
the top word), then discard the top word of the sum. For an executable
bootsector the lower word of the sum should be 0x1234.

Source record: 30861

Hi,

Has anyone some experiences using an MOD (Fujitsu M2512A) in combination
with an atari TT ?
The MOD is configured as direct access drive due to problems with HDDriver 2.81
if the dip switches are set to "optical device".
The MOD answers correct when the TT is booting.
- The cartridges are formatted (128/230 MB); should they also be partitioned
(as a large disc ?) and what's about the sectorsize and partition-id ?
- Using DISKUS (V 2.74) it's impossible to access the drive via absolute access,
partitioning is also not possible with HARDDPART (the button of scsi-device 2
is not selectable, what's wrong ?
- Should the cartridge be inserted in the MOD while booting ?
- In the manual there's something mentioned about a "macintosh-mode" which can
be activated with another dip switch; what is it ?
- If it would be possible to write some data on the cartrigdes, can I read
this files with an PC using OS/2 ?
- Linux68k isn't able to handle the drive, too ("unabel to determine sector
size", or something like that).

any ideas ?

thanks in advance,

Dirk

It's not the Hz value that your monitor cant display, the line-frequency gets
too low (TV has about 15.6kHz - but most monitors start at 27 to 30 kHz

I tried to contact you by e-mail, but my message bounced for some reason. Thanks for your response; you are the only one who has answered my call for help so far. I'll try to do as you suggested. My problem was (is) that after wasting a great deal of time patching the sources (which I had to do mostly manually, because the patch program rejected the vast majority of the hunks in the diff files), I tried compiling and well, the number of compilation errors was off the scale. So, let me see if I got this right: you suggest that I fix the paths on the sources for version 2.0, use the unix make files, and I should be off to the races, correct?

Gustavo

4390. GCC STILL doesn't work!

Newsgroup: comp.sys.atari.st.tech

I've been trying to get GCC to work for about 2 years now, on and off, and still can't get it going. I'm running a 1040 STe with Mint 1.08 and TCSH, and I have a minix partition set up for it. It runs the preprocessor just fine, but then it goes to create the object code, and it says /dev/k/tmp/c63000000.a file not found. and exits. I have the environmental variable TMP set for /dev/k/tmp, and there is a null folder /tmp there already. What can I do? By the way, I'm talking about the newly uploaded GCC v2.58 (I think it was 2.58 - the one that was just uploaded to umich)

Thanks,
Steve

Steve I had the same problem. What my problem ended up being was that I
had incorrectly defined a few of my enviroment variables.

Your compiler, linker and whatever are of the form "gcc-cpp.ttp, gcc-ld.ttp."
However gcc is really looking for the programs cpp, ld, ...

GCC prefixes these name with the GCCEXEC(?) environment variable and tries
to run them. If it can not it tries to run the first cpp or ld that it can
find in your PATH environment variable.

You must make sure that your GCCEXEC(?) environment variable is set to
'path-to-gcc-files/gcc-'. I had left off the '-' and the gcc preprocessor
would try to run my Mark Williams C linker because it was in my path.

Not a lot of fun to figure out.

Brian

4394. Software for sale or trade

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-19 00:52:25 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <330vo9$mna@mailer.fsu.edu>
Source record: 30879
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For sale or trade:

Well, time to clean out the software shelf! Below are a bunch of items I want to sell or trade. For buyers, highest reasonable offer gets the item, with preference going to those that buy more than one item. Shipping will be negotiated with the offer.

As for trades, let me know what you have and we may be able to work something out. I am looking for some games (Vroom, Chaos Engine, Armorgeddon, Prince of Persia, and many others), Stereotek 3D glasses, working Wico bat handle or Ergo joysticks, European ST magazines (ST Action and ST Review) and probably lots of other stuff. Cash can make up for deficient trade material from either party. Shipping will be negotiated with the trade (though for trades, I often suggest that both parties eat the shipping). Don't be shy, send me some email and let me know what you have to trade.

All of the items below are original commercial products owned by me. Unless otherwise noted, all original boxes, manuals, and disks are included. I have cheat codes for some of the games, and will include them with the sale/trade.

Please reply via email.

****Application and Utility****

Tempus v1.x, excellent text editor, not as good as Tempus II, but no slouch either. Blazingly fast (hence its name), even on a box-stock 8mHz system. Designed for programming, great for general editing as well.

Neodesk Command Line Interpreter, v. 2.0, adds a command line interface to Neodesk with MSDOS/UNIX style commands. More commands can easily be added (the GNU versions of standard UNIX utilities, for example). This version is really more MSDOS-like than UNIX-like, but the new version 2.1 (to which this can be upgraded) is supposed to be more UNIX-like. There are a couple of neat things about this CLI. First, it pops up in a window on the desktop, so a CLI is only a mouse click (or keyboard macro) away. One can drop batch files onto the CLI icon to execute them, which can be quite handy. Finally, it is quite small, primarily because it reuses the routines in Neodesk to do standard file operations (i.e. when the CLI copies a file, it uses the code already in Neodesk to do it). Only works with Neodesk.

Wordup v3.x, Neocept, with the large thesaurus and large dictionary extra options, plus lots of Genie notes about bug fixes and work-arounds. This is an excellent WYSIWYG word processor, but it does have some bugs. The rights to the code were purchased by Atari (and some of the code used in Atari Works, or so I hear). It is not buggy enough

to be unusable, just irritating at times. This is the final version
that was released.

TurboJet, Neocept, fast GDOS print driver for HP Deskjet and Laserjet
printers, includes a bunch of 150 and 300dpi GDOS fonts. Claims to
be 200-500% faster than other HP drivers (for that time, I don't know
if there are faster ones out now).

Microsoft Write for ST, buggy WYSIWYG word processor, the only Microsoft
product ever made for the Atari that I know of, includes a full
copy of Atari GDOS. Can be run from floppies and a ramdisk (Jeez,
did I really do that? I must have been really patient back then :-).
I managed to produce a bunch of papers and letters with it using only
a floppy and color monitor, so it is somewhat useful.

Personal Pascal, ICD, I believe this is the final version of this compiler.
The only limitation with it that I know about is that one cannot
pass functions as arguments. Other than that, it is a complete
Pascal compiler environment. The lack of this feature will not
hamper most Pascal programmers, IMHO. Good docs on both Pascal and
the Atari programming environment (it's a big fat softcover book).

Home Accountant, Haba systems, personal financial management software. One
can manage budgets, bank accounts, credit cards, print checks, etc.
It can also generate a tax summary and other budget things.

Time Link, Batteries Included. Excellent personal scheduling software.
Has a few bugs, but greatly useful stuff. Can search/sort database
of entries, shows one's schedule by the week, month, year, etc.
Very easy to use, well-designed GEM user interface.

Warp 9 v.3.75, Codehead, The (IMHO) second best screen accelerator for the
ST. Can be upgraded or used as-is on ST/STe/TT. I'll include lots of
extendo-save screensaver modules that I have collected. If you have
the bucks, NVDI is better IMHO, but Warp9 is vastly better than
nothing and significantly cheaper. This is the successor to QuickST.
Allows fancy desktop fills, mouse acceleration and effects, use of
different fonts on the desktop, and of course the cool extensible
screensaver.

Interlink, Intersect Software, telecomm program, supports vt100, very easy
to configure and use. Good macro capabilities. No Zmodem.
Original disk only, no docs (but the full Gem interface is quite
easy to figure out).

CAD 3-D v1.0, Antic, original disk accidently laundered (don't ask :-),
includes original docs plus backup floppy. This is not really for
architectural design (i.e. Dynacadd or Autocad), but to make nifty
3D animations for fun.

****GAMES (Arcade Action)****

Alien Syndrome, overhead view scrolling shoot'em up, lots of fun for two simultaneous players. Plenty of fast and furious shooting.

Captain Fizz Meets the Blaster-Trons, Psygnosis, sort of like a Gauntlet II in space, best with two simultaneous players (screen is split to give each player their own view). Overhead view, destruction galore.

Xevious, Mindscape, port of the stand-up Arcade game Xevious, vertical scrolling "fly over the landscape shooting and bombing everything" game.

Ballistix, Psygnosis, Bizzare soccer style game, where one shoots at the ball to move it around. Really great graphics, so-so gameplay.

Baal, Psygnosis, Excellent platform/adventure game (mostly arcade action). Future setting, sideways scrolling, large sprites, good guns. This is a pretty hard game, but lots of fun.

Enduro Racer and Crazy Cars, combo pack, no docs, Enduro Racer is a cross country motorcycle racing game, Crazy Cars is a racing game. Both are OK, though quite old.

Super Cycle, Epyx, no docs, oval track motorcycle racing.

Custodian, futuristic platform shoot'em up game, excellent graphics, fast scrolling, lots of weapons, etc.

Eliminator, strange driving/shoot'em up game, lots of different weapons and bad guys.

Frostbyte, Starsoft, side-view platform game, I would recommend it for a small child (in terms of its difficulty). A bit boring for us big children, IMHO.

President Elect 1988 edition, SSI, presidential election simulation, graphics are quite lame (mostly text, in fact), but I suppose a political process fan might like it. It does not appear to be particularly tied to the 1988 elections, and has data for US elections all the way back to 1960. Can apparently be used to predict elections as well.

****Adventures (Graphical Adventures, most with some arcade action)****

Temple of Apshai Trilogy (includes Temple of Apshai, Upper Reaches of Apshai, Curse of Ra), Epyx, full docs, classic blast from the past, nicely done. These are overhead view graphical role playing games (RPG).

Ultima III, Origin, with all docs, cloth map, box. Classic RPG adventure, by Lord British.

Questron II, SSI, RPG, very similar in look/feel to Ultima IV, in terms of graphics and gameplay. Medievil setting.

Bard's Tale, Electronic Arts, yet another RPG, very good. Graphically impressive for its time. Search through buildings, dungeons, and towns (Skara Brae) in 1st person 3-D graphics (small graphics window

and restricted movement, but this was many years before anything like
Doom was ever seen :-).

Mercenary: Escape from Targ and Second City, early 1st person 3D vector
graphics adventures. Future setting.

Gold of the Realm, Magnetic Images, very similar in look/feel to Ultima III,
in terms of graphics and gameplay. Medievil setting.

Breach, Omnitrend, classic RPG game, GEM interface mostly, future setting,
control a bunch of Space Marines as they search around and shoot
stuff.

4395. NEODESK 4 News...!!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-19 02:32:00 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <3315j0$p6i@golem.wcc.govt.nz>
Source record: 30874
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well I don't know if this got to atari.announce,
so I will post a copy here...

This was found on GEnie to-day.....

For Immediate Release 8/17/94

Gribnif Software is proud to announce the completion of the most
recent upgrade to the original desktop replacement for Atari computers,
NeoDesk 4. The wait is finally over.

NeoDesk has hundreds of features, so here are just some of the more
popular ones in the new version:

o A completely new "look and feel", including 3D windows, enhanced dialog
handling, and the ability to have multiple dialogs open at once. All
this works on any Atari computer with any ROM version.

o Multicolored icons - each icon can have up to 16 colors, and can even
appear completely different when selected.

o Icon Editor - This multiple window Icon Editor lets you edit and modify
custom icons for any file or folder. The editor can read many popular
icon formats, including ones from other platforms!

o Any Degas, Neochrome, Tiny, IMG, or BMP picture can be viewed (by
double-clicking on it) or can be used as the desktop background.
Desktop pictures can even be "tiled".

o Each directory window has its own menu bar, making it much easier to
find frequently used options.

o Each window has its own "parent directory", Show Info, and trashcan
icons.

o Items can be selected from the keyboard, including a search mode.

o File Groups - Now you can arrange commonly used programs and data files
together in the same window, even when they are physically contained in
drastically different locations! Their names can even be changed,
using up to 20 characters.

o Font Control - NeoDesk 4 gives you the power to redefine what fonts
and point sizes are used within its windows, and even for the text
underneath icons.

o Disk copy, file operations, and floppy disk formatting can all occur "in the background", allowing you to use your computer for other tasks at the same time.

o Search Files - Easily search your system for one or more files, based on their name, size, date, or attributes. A file group can even be created containing the results. This is just one example of the powerful Filtering options which are also available for file operations.

o Compatible with all Atari computers, in all resolutions, including third-party graphics cards.

NeoDesk 4 is available for just $69.95 plus $4.15 S&H. Owners of NeoDesk 3 can upgrade to the new version for $25 + $3 S&H by sending us both original NeoDesk 3 master disks. Backorders are being filled right now, and may take 2-3 weeks to complete.

(Shipping amounts listed apply to orders shipped within the USA only. Please contact us for other areas.)

] o Multicolored icons - each icon can have up to 16 colors, and can even
] appear completely different when selected.

Only on machines with decent graphics modes though :(

] o Any Degas, Neochrome, Tiny, IMG, or BMP picture can be viewed (by
] double-clicking on it) or can be used as the desktop background.
] Desktop pictures can even be "tiled".

Woohoo! Finally I can get the wierd looking BMP's I've made onto the
desktop on my ST! :)

] o Each directory window has its own menu bar, making it much easier to
] find frequently used options.

I hope that can be disabled. In 640*200 I need all the space I can get!

Something NEOdesk needs is a "Files read from source" counter while copying,
as copying hundreds of files with lots of RAM, you don't get a great idea
of how much has been read in yet! Also, an option to continue file
copying after one has been detected as corrupt would be good. (Maybe there
is but I haven't picked it out!)

Also, something I couldn't spot in the Neodesk manual was that if you hold
down ALTERNATE when NEODESK.EXE is executed by NEOLOAD.PRG it will be
bypassed and drop to the normal desktop. Handy if you need a fraction
more RAM & in a hurry! :)

It's just a sum over 16bit words modulo 2^16. But you can let
Protobot() do it for you, just pass it the prepered buffer with all
parameters set to -1 except for the first(?) that specifies if the
bootsector should be executable. Then it will only change the last two
bytes to make it the right checksum.

On medium res the icons can have any of the 4 system colors. TT-Res and
above you can have 16 colors. Mono only get to choose between b/w.

I'm pretty sure we documented this in the read_me for NeoDesk 3.0x.
Geneva has the same type of "abort loading" support.

.tgz is equivalent to .tar.gz If you want to decompress it, you have to use gunzip filename.tar.gz, then tar -xf filename.tar or whatever you normally use for un-gzip-ing and un-tar-ing. (Cripes, what a bastardization of the English language... isn't there an easier way to say that?)

> Any help greatly appreciated.

Without hardware modifications, your ST can handle serial speeds of 19200 and below. From experience, 14400 baud modems work fine and give good performance at this line speed. I would presume that a 28800 baud modem would not like being restricted to 19200 (though it would probably work). To use such a modem, a hardware mod like RSVE or TurboRS (the latter is made in Canada) would be very desirable. You can find out about RSVE from the file in /Utilities/Tosfixes on atari.archive.umich.edu. For info on TurboRS, try emailing Kevin Tessner at ktessner@isle.waterloo-rdp.on.ca.

For high speed modem use, the hsmoda04 patches are important. These are small auto folder programs that fix bugs in the TOS serial stuff, enhance performance, and allow you to set the sizes of various serial buffers. This package is available in the above mentioned directory.

Source record: 30795

Anyone tell me if it's feasible to connect a Conner CP30100 to an STe? I've currently got a Qunatum Q250 (52Mb) and a Segate ST277N (65Mb) fitted and I want more space. I've got a buyer for my current drives and I'm looking around for a replacement. (I can only fit two drives in my HD case.)

I've had a look at the Conner CP30100 specs and can find no mention of parity which, AIUI, can cause problems.

Anyone using a Conner CP30100 with an ST setup?

ATB,
Karl.

No ,you can in theroy relly use upto 19200 bps rate on any ST ,
regardsless of the TOS version. But as always there are a few
small software bugs in different version of TOS in handling of
the flow control.

If you have TOS 1.0 or 1.4 then you'll most likely need a fix for
these bugs. Many fixes are avaliable such as:
ctsfix ,tubocts ,rs232fix ,hs_fix10 ,serptch2 ,ctspatch .. .

You should be get them form most ftp sites.

Dwhite@rd.Eng.Bbc.Co.Uk,
In a message on 19 August, wrote :

dT> What is filename.tgz decompresssable with? I've never seen it before.
dT> -David White

It is short for filename.tar.gz
That is, a tar archive (.tar) which is compressed with gzip (.gz)
It can be uncompressed with gunzip (or gzip -d filename.[t]gz). Then you can
extract the files from the archive with tar xf filename.tar.
Or, if you have a working mint environment with both gnutar (1.11.2) and
gzip in your PATH: tar xfz filename.tgz

If this sounds greek (no pun intended) to you, do the following if you have
a mysterious *.tgz file:

download tar.ttp from somewhere.
download gzip.ttp or gunzip.ttp from somewhere (typically atari.archive)

doubleclick gunzip/gzip .ttp
in the dialog that follows; enter "-d filename.tgz".

That should produce a "filename.tar" file.

Then, doubleclick tar.ttp
in the dialog that follows; enter "xvf filename.tar"

voila.

The flag "-d" means decompress for gzip/gunzip
The flag "xvf" means e[x]tract [v]erbose [f]ile for tar.

The "z" flag to tar, means that it should automagically use gunzip to
decompress the file. This will only work with versions 1.11.2 or later of
tar under MiNT. Older versions try to execute compress instead of gzip.

Hope this helps.

Erling

If only you would have a falcon or TT...
Anyway, to all others out there:

I recently uploaded a generic SCSI tape device driver along with generic
scsi drivers for TT and Falcon for use with MiNT.
(/dev/scsi, /dev/cdrom, /dev/tape)

This "should" work with any tape device, and has thus far been tested on a
Tandberg streamer, a Wangdat and an Exabyte device. It works very well in
combination with gnutar, and ofcourse read/write tapes written on a unix
machine with tar just fine.

A precompiled gem-based configuration program for the tape driver is also
uploaded, but it will only work with '030 machines...

Nothing particular had to be done in order to make it work on the
different drives mentioned, so it "should" work without modification - but
who knows - that is what the configuration program is for :-)

A device for ACSI remains to be written, and I hereby encourage all
knowledgeable people to help out with that (!!!!!!!!!!!!!!!!!!!!!!!!!).

The source code (only) is available on atari.archive.

Wangtek probably could. I have had excellent success with contacting peripheral companies and getting information. Just about everyone I have called ends up sending me huge OEM manuals and software for free (and I usually just need the jumpers, as in your case). Some companies have a phone database with which one can look up all of this information right on the line (Maxtor is one). Anyway, I suggest you call 1-800-555-1212 and see if their number is listed there. If not, call up a couple of drive resellers and see if you can get ahold of their phone number.

There are some pertinent files on atari.archive.umich.edu (tapebios, special version of GNUtar, etc.). Grab the topmost 0index file and search for "tape". You should also check out GEMar. This is a superb shareware program for SCSI tape use. It has all the bells and whistles that one might want (and writes tapes that are tar compatible, BTW). Also, the newest Diamond Back 3 can make use of SCSI tape drives (that portion of the product is fairly young, though).

Hi! I've had the same problem on my Mega STE 4/48, but the solution seems to
be to reboot TWICE, holding down the alt-key both times...

The first time, the computer ignores the auto-folder, but doesn't boot from
the HD. The second time, it boots on the disc, as it should.

I don't know if this will work with coldboots, as I've only tried warmboots...

Another boring thing with my computer: it defaults to 8 MHz w/o cache...
I would love to have a program like "Backwards" on the Falcon, to be able
to run my old boot-disc programs in 16 MHz-mode with cache enabled...

Hope this helps!

Hi Dave. I have a Wangtek like yours, and i'm using Gemar as program.
Unfortunatly i can't give you the jumpers settings, but my streamer works
fine like it is. (The ID jumers is stiing just beside the Scsi plug).

Right now i'm trying to find out all these jumpers myself, i did get a
list of the jumpers, but that list doesn't look like my streamer. I'll
get back to you as soon i have sorted it all out. Meanwhile you can have a
look at this list too.

I noticed a few docs about hardware mods to support 38400 baud in older st's. (Simply modifying the timer registers of the serial port to emulate 38400 baud yields an unstable baud rate, so a hardware mod is necessary for > 19200 baud). Has anyone experience with one of these mods, especially under MiNT (1.10h9)?

Thanks

>still can't get it going. I'm running a 1040 STe with Mint 1.08 and TCSH, and

If you only have a 1040 with 1024K then you are not going to get it to
work.

The absolute minimum specs IMO are:

2MB with a hard disk
2.5Mb with twin 720K floppies.

With such small configs, you're only going to be able to run GCC 1.40 at
the most. Also you'd need to run a minimal system such as gulam instead
of MiNT.

I gave up with anything above 2.33 on a 4Mb machine as it kept
running out of memory.

:-(

Roland.

4429. Falcon WD IDE problems...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-21 23:58:14 UTC
From: gert@ttgk.textlitho.nl
Message-ID: <Up-EHWAECUQ@ttgk.textlitho.nl>
Source record: 30812

Hi,

Does anyone out there know if there exists a EPROM board for the Falcon so you can upgrade or patch TOS yourself ?

Problem is that I mounted a Western Digital Caviar 2340 IDE (enhanced) into a Falcon only to find out that there is a bug in the TOS which makes autoboot from power-on impossible.....
The drive needs to have it's physical parameters set before it wants to boot. With Hushi's cd-boot software we finally managed to get things going, but a boot floppy is needed (in fact only 1 sector) to 'activate' the drive after which it boots like lightning... Even after CTRL-ALT-DEL or reset it boots fine, without the floppy.

We tried AHDI 6.06, ICD 6.20 and ICD Pro but to no avail, with AHDI and ICD the drive isn't booting either and when ICDBOOT.PRG or AHDI.PRG is run from floppy (with the PREBOOT sector from Hushi), the harddisk comes alive but the floppy drive is no longer working, not even after a reset or cold-boot (CTRL-SHIFT-ALT-DEL) only a complete power down reactivates the floppy.
So we thought of patching the TOS (as there is, to our knowledge, no Falcon TOS which has this bug fixed) problem is that the Falcon TOS isn't put in ordinary EPROMS/ROMS but in a special chip.
Maybe there is a small EPROM board for the ROM port ?

The drive itself performs very well after this boot-syndrome: 1370 k/s and access time below 15 ms !

Another advantage is that the drive consumes very little power: 5V 0.33Amp and 12V 0.11 Amp, so it can be connected to the original Falcon power supply! (which has a 'very big' output of 0.2 Amp at 12 Volt :-[ )

4430. Help Setting Desktop Font in GEM.CNF?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-22 02:17:04 UTC
From: scotty@cais2.cais.com
Message-ID: <3391r0$b6a@news.cais.com>
Source record: 30810

Hi Folks!

My newly outdated Compendium says that I can set my AE_FONTID in my GEM.CNF file to a valid Speedo Font ID to change the GEM default font. It similarly claims that AE_PNTSIZE sets the font size in points.

Has anyone had any luck with this? I have a Falcon with TOS 4.04, and I'm using MultiTOS 1.10 as of this month. I've tried putting in the following lines in GEM.CNF:

```
setenv AE_FONTID=16
setenv AE_PNTSIZE=10
```

And this has no effect.

Part of the problem may be the font ID itself -- I picked 16 because I want to use MonoSpace 821, and that's the 16th font I have listed in OUTLINE.PRG when I run it. I tried looking at EXTEND.SYS, but there are no font IDs listed in it either (at least in a plain decimal format, as the Compendium gives in its example). I have also tried setting this to lower numbers (such as 3) with no change. I always get the standard desktop font!

Thanks for any help. If anyone else is interested, I'll forward the response to him or her.

The ELS series cannot be used with the Atari unless you have
firmware 4.05 or greater, then parity can be disabled via software.

The LPS series have a jumper EP that can be removed in order to make
it work.

hold the drive so that the SCSI port is on your left.
at the bottom left corner there should be several jumpers
count from left to right 5 sets of jumpers this is the EP jumper
take it off!
it should work!

I have used such a drive : it does USE PARITY and it's a hardware fact,
you can't disable it with a soft command (like on a Quantum drive).
Anyway, it has worked fine with an AdSCSI+ from ICD

Don't use setenv. Just do:
AE_FONTID=16
AE_PNTSIZE=10

>Part of the problem may be the font ID itself -- I picked 16 because I want
>to use MonoSpace 821, and that's the 16th font I have listed in OUTLINE.PRG

Nope. The font ID is independent of the assign.sys/extend.sys
ordering, it is encoded into the font file. You *may* find it in the
.TDF files though (they're ASCII)...

It really isn't worth the effort; most of the time you'll get text
overrunning dialog boxes and menus, and it'll look pretty messy.

4435. MasterBrowse 4.7 available

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-22 09:11:34 UTC
From: vctec@westminster.ac.uk
Message-ID: <CuxIwJ.2nH@westminster.ac.uk>
Source record: 30816

MasterBrowse 4.7 has now arrived at

micros.hensa.ac.uk (micros/atari/tos/n/n114/mb47_bin.lzh)

Below is a description by the author...

Download and Enjoy....
Danny

August 20, 1994

M a s t e r B r o w s e 4 . 7
""""""""""""""""""""""""""""""""""

Copyright 1993, 1994, Michel Forget
Electric Storm Software

There is a new version of MasterBrowse available!

Using FTP, you can get the new version of MasterBrowse (when it is
validated) from either of the following addresses:

atari.archive.umich.edu (/atari/Newitems/mb47_bin.lzh)
ftp.tu-clausthal.de (/pub/atari/Newitems/mb47_bin.lzh)

Both of the FTP sites mentioned above can be accessed using a mail
server, for those who do not have FTP access. The file will also appear
soon (with the name MB47_BIN.LZH) on GEnie, Delphi, and CompuServe. In
addition, the new version of MasterBrowse will appear at micros.hensa.ac.uk
soon.

For those who have never used MasterBrowse before, a detailed
description of the program will follow the list of new features and
bug fixes.

~ ~

MasterBrowse 4.5:

NEW FEATURE: MasterBrowse now has even more powerful windowed dialog box
editing capabilities. The following keys can be used inside
a windowed dialog box:

UNDO = Exit (Cancel)
Return = Exit (Done)
TAB = Next Editable Field
Control + TAB = Previous Editable Field
Shift + Left Arrow = Start Of Editable Field
Shift + Right Arrow = End Of Editable Field

Shift + Up Arrow = First Editable Field
Shift + Down Arrow = Last Editable Field
Control + Left Arrow = Start Of Previous Word
Control + Right Arrow = Start Of Next Word
Shift + Backspace = Delete From Start Of Field
Shift + Delete = Delete To End Of Field

Alternate + [UNDERLINED LETTER] = This will exit the dialog
box as if you had clicked on
the button containing the
underlined letter.

NEW FEATURE: MasterBrowse now has context sensitive online help, if you
use the ST-Guide accessory. If the accessory is installed
on your system, pressing the Shift + HELP key will cause
MasterBrowse to instruct ST-Guide to open a window with
information relavent to your current position. Since all
of the information is external, this option does not affect
the size of MasterBrowse at all, or how much memory it
uses. The entire MasterBrowse manual is available (accessed
by entering the help system while you are NOT in a dialog
box).

NEW FEATURE: When marking a block, the SHIFT key can be used to "continue"
a previously marked block. This means that the start of the
block will remain the same, and you are only adjusting where
it ends.

NEW FEATURE: MasterBrowse now has an "Edit" menu; "Clip Block" is now
"Copy" and "Open Clipboard" is now "Paste". This change
was implemented so that MasterBrowse would be more compliant
with existing (and future) standards.

NEW FEATURE: MasterBrowse now has a "Delete" option under the "Edit"
menu; it will delete the SCRAP.TXT file inside the
clipboard folder.

NEW FEATURE: The keyboard shortcut manager has been completely rewritten;
you can now add and remove keypresses at will, and change the
keyboard shortcut for ANY action (not just menu entries).
MasterBrowse no longer makes any distinction between the
left shift key and the right shift key. The interface to
the keyboard shortcut manager has also been rewritten; it is
now much more user-friendly!

BUG FIX: Selecting "Skip" in the colour configuration dialog box will
no longer cause MasterBrowse to set that colour to white.

BUG FIX: If the text or background colour is chnged, the window affected
is now completely redrawn.

NEW FEATURE: MasterBrowse now has a push/pop position feature; this can be
thought of as a temporary bookmark. You "push" (set) the

position, then "pop" (unset and move to) the position. This
is much faster than setting a bookmark because it does not
cause a dialog box to appear on the screen.

MasterBrowse 4.5a:

BUG FIX: The file selector should not work correctly (again).

BUG FIX: AutoSave Options will now always save the options to the
path pointed to by MB_CONFIG.

BUG FIX: If you have previously registered MasterBrowse, copy your
USERINFO.DAT file into the new MasterBrowse directory.
MasterBrowse will analyze the file; if it is valid, the
"MasterBrowse Information" dialog box that is shown to
unregistered users will not be shown to you. This did
not work (at all) in the last version, for which I
humbly apologize.

MasterBrowse 4.7:

NEW FEATURE: MasterBrowse no longer uses an internal font selector; instead,
it can now interface directly with the Universal Font Selector,
by Michael Thanitz. The Universal Font Selector is much more
reliable than the internal font selector previously used by
MasterBrowse. The MasterBrowse Installation Program will
copy UFSL.PRG to your /AUTO folder automatically, so no extra
effort on your part is required.

NEW FEATURE: MasterBrowse now uses windowed progress displays, so loading
a document no longer prevents other applications/accessories
from executing in the background and it allows you to switch
from one application to another while a document is being
loaded. (NOTE: If you turn off progress displays, the
loading speed will be markedly faster.)

NEW FEATURE: To make using ST-Guide with MasterBrowse easier, you can now
set the name of the ST-Guide accessory. To do this, create
an environment variable called "HELP_ACC" and set it to the
filename (no path and no extension) of the help accessory.

Example:

You would like MasterBrowse to use TEST.ACC, instead of
ST-GUIDE.ACC. Add the following line to GEM.CNF:

setenv HELP_ACC=TEST

If you have Mag!X, you would add the following line to
MAGX.INF:

#_ENV HELP_ACC=TEST

That is all that there is to it. In order, MasterBrowse
will look for HELP_ACC, 'ST-GUIDE', and 'STGUIDE'.

INSTRUCTIONS: The HyperText documentatin has been improved to take better advantage of the power offered by the ST-Guide utility.

BUG FIX: Selecting "Close All Documents" will now clear the list of open documents, so you can use the "Quick Access" feature without getting an error message.

INSTALLAITON: The MasterBrowse Installation Program:

NEW FEATURE: If the destination path you specify in the installation path contains folders that do not exist, the installation program will now create them.

NEW FEATURE: If there is no AUTO folder, the installation program will now create one on the boot device.

NEW FEATURE: The destination path no longer needs to be terminated by a '\' character.

BUG FIX: The file selector will no longer contain an invalid path specification if you double-click on an editable text field.

NEW FEATURE: The installation program will no longer generate an error if the destination file exists during a copy operation. The old file will silently be erased.

NeoDesk 4 works with Geneva, MultiTOS/MiNT, and MagiX!. Our plan is to
continue insuring that it works in those environments, even as newer
versions are released (this applies mostly to MagiX!/MagiC, which is
still evolving).

I notice that the circuit diagram for Atari monitor SM124 is available via
anonomous FTP from uni-paderborn as a scanned copy. Is this legal? I presume
someone owns the copyright for it.
If it is, would anyone like to do the same with the circuit
diagram for an SM144 monitor? I can't seem to find a reasonably cheap source
for it anywhere. (i.e. less than 35 UK pounds)

Hello,
I've recently been thinking about spicing up my STe with an accelerator or something. Today someone offered me a Mega ST(fm) 1 for not much money. I was wondering how compatable games and other s/w that I run on the STe will be on it ? Is it worth upgrading to a mega ST - I don't know much about them at all ! - do they take simms ?

Any help/info would be greatly appreciated - and if you could e-mail it to me I would be even more grateful !!

Cheers,
Dylan

4442. Running speed of US Jag carts on PAL Jag

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-22 17:00:03 UTC
From: bseddon@molbiol.ox.ac.uk
Message-ID: <1994Aug22.170003.1@molbiol.ox.ac.uk>
Source record: 30823

Concerning the running of US Jag carts on UK machines, whilst it is clear this is possible (I have a Wolf3D cart from HMV Oxford, which I assume is US since it has no French description on the packet, and has small black strips at the top and bottom of the TV in-game display), is there any advantage to using US over UK? The UK versions, as I understand it, have large screen displays because of differences between PAL and NTSC displays. I know that a game runs slower on a PAL cf NTSC, but will a US cart run faster on a PAL Jag than a UK cart on a PAL Jag coz of screen size differences? If so, am I better getting US versions of games when I can?
Thanks in advance,

Ben...
P.S. Sorry this isn't quite the right news group, but I'm not sure if my posts to r.g.v.a are getting distributed correctly.

sH> listed in it either (at least in a plain decimal format, as the Compendiu
sH> gives in its example). I have also tried setting this to lower numbers
sH> (such as 3) with no change. I always get the standard desktop font!

Look at the filenames of the fonts. The monospace 821 font, is named
"BX000596.SPD", which means that it has fontid 596. However, if you are
using the newest version of SpeedoGdos, add 5000 to the fontid (5596). This
was done to avoid speedo fontid's clashing with bitmap font id's.

sH> Thanks for any help. If anyone else is interested, I'll forward the resp
sH> to him or her.

Hope this helps...

Check that it is STE... otherwise, you'll need to do some soldering for an
upgrade. Check the TOS type... otherwise, it is basically a 1040 with
a detatchable keyboard.

The MEGA ST is way older than your STE, but they are in some ways a better system, you can fit graphics cards, also used to drive the Monoterm monitor, they only use drams, not sipps, and they don't have the same sound and graphic features that the STE has..

The Mega ST was Ataries Pro version of a STF, what you need is a MEGA STE..

4451. Advice Please - ST Upgrade.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-23 15:00:18 UTC
From: Kevan.Winch@eccles.seuk.com
Message-ID: <438_9408232323@seuk.com>
Source record: 30835

Hi Folks,

At present I have a 520 STFM with 1Mb RAM. 1Mb D/D. No HD, Mono Monitor,
and .....wait for it.....TOS 1.02 (1.2).

I'm toying with the idea of getting a PC. (Arghhhh, ouch, oohh, stop it !, ok, ok, I take it back, just stop throwing the rocks OK ! <g>) You see, I use an IBM PS/2 at work, it's slow for a PC - 16MHz 386, but it does have a HD, VGA colour screen, and I run Windows 3.1 on it.

Now, I use my ST for MIDI sequencing mainly, along with a few games.

Can I start a debate here on the pros & cons of ST v PC. ?
I *do* like my ST, it's grown on me a lot, but it does have some serious disadvantages to a PC, as far as I can see.

Drawbacks of the ST compared to the PC
======================================

TOS is *awful*, compared with Windows, it really is out of the ballpark. It is SLOW compared to Windows, even on my 16MHz 386.

The screen resolution is not as good as VGA. (Mono Hi-Res is great, but it's MONO !)

The ST system font makes me feel ill. I wish I could change it for something like the PC standard one.

The keyboard is terrible to type on, it's ok for pressing the odd key, but not for serious work.

No HD

Advantages of the ST compared to the PC
=======================================

It has MIDI ports.

umm........

I HONESTLY want to be able to put more to the latter list, but I can't think of anything else.

I would like to upgrade my ST, so that it runs faster, nicer, smoother etc etc and doesn't give me cause to complain about it, but if that upgrade is going to cost more than a secondhand PC, then.....sadly I would have little choice.

I would prefer to keep my ST, as it is MINE, and we've been through a lot together. I've had her for years and she's never given me a sniff of trouble (apart from when I blew the disk drive whilst upgrading the RAM (my fault !))

Can someone air their views here please ?????

4452. Software for sale or trade

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-23 22:13:52 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <33dsb0$54i@mailer.fsu.edu>
Source record: 30745
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For sale or trade:

Well, time to clean out the software shelf! Below are a bunch of items I
want to sell or trade. For buyers, highest reasonable offer gets the item,
with preference going to those that buy more than one item. Shipping will be
negotiated with the offer.

As for trades, let me know what you have and we may be able to work something
out. I am looking for some games (Vroom, Chaos Engine, Armorgeddon, Prince
of Persia, and many others), Stereotek 3D glasses, working Wico bat handle
or Ergo joysticks, European ST magazines (ST Action and ST Review particularly)
and probably lots of other stuff. Cash can make up for deficient trade
material from either party. Shipping will be negotiated with the trade
(though for trades, I often suggest that both parties eat the shipping).
Don't be shy, send me some email and let me know what you have to trade.

All of the items below are original commercial products owned by me. Unless
otherwise noted, all original boxes, manuals, and disks are included. I have
cheats for some of the games, and will include them with the sale/trade.

Please reply via email.

****Application and Utility****

Tempus v1.x, excellent text editor, not as good as Tempus II, but no slouch
either. Blazingly fast (hence its name), even on a box-stock 8mHz
system. Designed for programming, great for general editing as well.

Neodesk Command Line Interpreter, v. 2.0, adds a command line interface to
Neodesk with MSDOS/UNIX style commands. More commands can easily
be added (the GNU versions of standard UNIX utilities, for example).
This version is really more MSDOS-like than UNIX-like, but the new
version 2.1 (to which this can be upgraded) is supposed to be more
UNIX-like. There are a couple of neat things about this CLI. First,
it pops up in a window on the desktop, so a CLI is only a mouse click
(or keyboard macro) away. One can drop batch files onto the CLI icon
to execute them, which can be quite handy. Finally, it is quite
small, primarily because it reuses the routines in Neodesk to do
standard file operations (i.e. when the CLI copies a file, it uses
the code already in Neodesk to do it). Only works with Neodesk.

Wordup v3.x, Neocept, with the large thesaurus and large dictionary extra
options, plus lots of Genie notes about bug fixes and work-arounds.
This is an excellent WYSIWYG word processor, but it does have some
bugs. The rights to the code were purchased by Atari (and some of
the code used in Atari Works, or so I hear). It is not buggy enough

to be unusable, just irritating at times. This is the final version
that was released.

TurboJet, Neocept, fast GDOS print driver for HP Deskjet and Laserjet printers,
includes a bunch of 150 and 300dpi fonts. Claims to be 200-500%
faster than other HP drivers (for that time, I don't know if there
are faster ones out now).

Microsoft Write for ST, buggy WYSIWYG word processor, the only Microsoft
product ever made for the Atari that I know of, includes a full
copy of Atari GDOS. Can be run from floppies and a ramdisk (Jeez,
did I really do that? I must have been really patient back then :-).
I managed to produce a bunch of papers and letters with it using only
a floppy and color monitor, so it is somewhat useful.

Personal Pascal, ICD, I believe this is the final version of this compiler.
The only limitation with it that I know about is that one cannot
pass functions as arguments. Other than that, it is a complete
Pascal compiler environment. The lack of this feature will not
hamper most Pascal programmers, IMHO. Good docs on both Pascal and
the Atari programming environment (it's a big fat softcover book).

Home Accountant, Haba systems, personal financial management software. One
can manage budgets, bank accounts, credit cards, print checks, etc.
It can also generate a tax summary and other budget things.

Time Link, Batteries Included. Excellent personal scheduling software.
Has a few bugs, greatly useful stuff. Can search/sort database
of entries, shows one's schedule by the week, month, year, etc.
Very easy to use, well-designed GEM user interface.

CAD 3-D v1.0, Antic, original disk accidently laundered (don't ask :-),
includes original docs plus backup floppy. This is not really for
architectural design (i.e. Dynacadd or Autocad), but to make nifty
3D animations for fun.

****GAMES (Arcade Action)****

Alien Syndrome, overhead view scrolling shoot'em up, lots of fun for two
simultaneous players. Plenty of fast and furious shooting.

Captain Fizz Meets the Blaster-Trons, Psygnosis, sort of like a Gauntlet II
in space, best with two simultaneous players (screen is split to give
each player their own view). Overhead view, destruction galore.

Ballistix, Psygnosis, Bizzare soccer style game, where one shoots at the
ball to move it around. Really great graphics, so-so gameplay.

Baal, Psygnosis, Excellent platform/adventure game (mostly arcade action).
Future setting, sideways scrolling, large sprites, good guns. This
is a pretty hard game, but lots of fun.

Enduro Racer and Crazy Cars, combo pack, no docs, Enduro Racer is a cross
country motorcycle racing game, Crazy Cars is a racing game. Both

are OK, though quite old.

Super Cycle, Epyx, no docs, oval track motorcycle racing.

Custodian, futuristic platform shoot'em up game, excellent graphics, fast scrolling, lots of weapons, etc.

Frostbyte, Starsoft, side-view platform game, I would recommend it for a small child (in terms of its difficulty). A bit boring for us big children, IMHO.

President Elect 1988 edition, SSI, presidential election simulation, graphics are quite lame (mostly text, in fact), but I suppose a political process fan might like it. It does not appear to be particularly tied to the 1988 elections, and has data for US elections all the way back to 1960. Can apparently be used to predict elections as well.

****Adventures (Graphical Adventures, most with some arcade action)****

Temple of Apshai Trilogy (includes Temple of Apshai, Upper Reaches of Apshai, Curse of Ra), Epyx, full docs, classic blast from the past, nicely done. These are overhead view graphical role playing games (RPG).

Ultima III, Origin, with all docs, cloth map, box. Classic RPG adventure, by Lord British.

Questron II, SSI, RPG, very similar in look/feel to Ultima IV, in terms of graphics and gameplay. Medievil setting.

Bard's Tale, Electronic Arts, yet another RPG, very good. Graphically impressive for its time. Search through buildings, dungeons, and towns (Skara Brae) in 1st person 3-D graphics (small graphics window and restricted movement, but this was many years before anything like Doom was ever seen :-).

Mercenary: Escape from Targ and Second City, early 1st person 3D vector graphics adventures. Future setting.

Gold of the Realm, Magnetic Images, very similar in look/feel to Ultima III, in terms of graphics and gameplay. Medievil setting.

Breach, Omnitrend, classic RPG game, GEM interface mostly, future setting, control a bunch of Marines as they search and shoot stuff.

4453. Re: Suitable CLI for Mint?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-23 23:42:00 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <Cv0Hu0.14y@cix.compulink.co.uk>
Source record: 30833

>I'm running a falcon, 4M, 120MB. What is the best cli to use? It needs to

I use KSH (v4.8) though most people use TCSH.

>toswin to grab huge amounts of memory when it is run? It isn't an
>important matter as I can use miniwin quite easily.

If you are opening up more than 2 shells, then TOSWIN starts becomming more
memory efficient.

>Also, is Mintos worth the hassle?

IMO yes, but it depends what sort of hardware you have, and what you intend
to do with it.

Roland.

Source record: 30831

Frits.

Ever since the Falcon was introduced, there has been talk of 386SX and 486SX hardware emulators being released for it. Unfortunately, due to the Falcon selling so poorly (compared to other ST machines), no one has made one yet. There has been talk that COMPO was supposedd to release one this very summer but I have heard that rumor over and over again and don't believe it.

I probably would have kept my Falcon if such an emulator had come out...

Ari

The suitable CLI for MultiTOS is TCSH. It runs perfectly on a TT and uses MINIWIN (from the Atari distribution.)

Message-ID: <33eh03$ola@uqcspe.cs.uq.oz.au>
Source record: 30834

dwhite@rd.eng.bbc.co.uk (David White) writes:

>I've been wondering.... is it possible to load more than one resource
>file?

Yes. There are two ways.

1. Write your own code to load resource files.
or 2. Write code that copies loaded resources, then load/copy/free
to load resources.

The code to do (2) is useful for other reasons (eg. having
multipl copies of a dialog). The code for (1) is useful because
you can then improve the way resources are loaded (eg. you can scale
images, use a different character-boundary scalig algorithm, etc.).

GEM++ does (1).

4457. [HELP] F: partition gone! (Falcon)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-24 07:07:43 UTC
From: jhh@cwi.nl
Message-ID: <Cv12Gw.421@cwi.nl>
Source record: 30836

Hi,

The subject says it all really. I was using my Falcon (4Mb/65Mb IDE) for
the first time in a month, and suddenly my F: (and last) partition of the HD
was gone. I couldn't cd to it in Gulam, and on the dekstop the icon was
still there, but clicking caused the bee to appear and to disappear again
after a second. No window for drive F: appeared.

HDX says the bootsetor is corrupted. Just prior to this behaviour, I overloaded
my E: partition when unpacking files with lharc. Might this be a bug in either
lharc or TOS/AHDI (I think I use AHDI 6.0) (i.e. overwriting the bootsector
of the next drive if the current drive is full?).

Has anybody got any idea how to repair this? Most of the stuff on the drive
is not important, but I really, really would like to get some of its data back!
Are there any HD-repair programs for the Falcon, or running on the Falcon.

If you can help, it would be very much appreciated!

Kevan Winch (Kevan.Winch@eccles.seuk.com) wrote:

: At present I have a 520 STFM with 1Mb RAM. 1Mb D/D. No HD, Mono Monitor,
: and .....wait for it.....TOS 1.02 (1.2).

: Now, I use my ST for MIDI sequencing mainly, along with a few games.

: Can I start a debate here on the pros & cons of ST v PC. ?

OK....go ahead.

: I *do* like my ST, it's grown on me a lot, but it does have some serious disadvantages to
a PC, as far as I can see.

The PC too, has many disadvantages compared to an ST...

: Drawbacks of the ST compared to the PC
: ====================================

Why are you comparing a ST to a 386 PC?

: TOS is *awful*, compared with Windows, it really is out of the ballpark. It is SLOW
compared to Windows, even on my 16MHz 386.

Get TOS 2.06...or one of the multitasking ones....MagiC/Geneva or even
MultiTOS (MTOS only if you have an accelerator).
I notice a big difference in speed between my 2.06 at home, and this
1.02 at work.

Cost, on average....around 60 pounds.

: The screen resolution is not as good as VGA. (Mono Hi-Res is great, but it's MONO !)

You can get a graphics card....you seem to want colour....ask System
Solutions. You may also get one second hand...scan ST Applications for
second hand ones that people are selling.

: The ST system font makes me feel ill. I wish I could change it for something like the PC
standard one.

Get NVDI 2.5 (3.00 out soon). This will allow you to change the system
font to either the Mac one, or a PC one, as well as speed up many
things on screen. I can't live without it. This is now available for 30
pounds.

Or you may go for one of the public domain things....there are a couple
out there...or when Harlekin was given away on a cover disk a while
ago...you can change the font in that.

: The keyboard is terrible to type on, it's ok for pressing the odd key, but not for serious work.

Buy keyclicks...they change the keyboard so that you don't feel like you are typing on a spectrum keyboard. Cost -- 15 pounds. Or you may go for one of these PC keyboard and interface things. Interface costs around 50, and a keyboard can be picked up for next to nothing from anywhere.

: No HD
Build a kit yourself. get a second hand drive for peanuts. Max cost for a 100 Mb drive from a market or something...around 30 pounds. Get the case and power supply and SCSI interface....cost there...around 100 pounds.

Or go for one of the IDE TOS 2.06 upgrades. I expect the price to be around 60 pounds for that. The you can buy an IDE drive which many retailers are selling quite cheap. Brand new 400 Mb drive for 150 pounds.

: Advantages of the ST compared to the PC
: ====================================

: It has MIDI ports.

The Atari market is not so big, that you are swamped by it. I see this as an advantage. You know where you astand. You can communicate with other Atari owners, and dealers on a more personal level. You go to a newsagents...and are not spoilt for choice, on which magazine to buy (although it is sad that STU has gone).

You just go in, buy the mag, and come out...instead of standing there for the next half an hour contemplating which one to buy....most of them are full of adverts anyway, and no editorial content.

The Atari is a lot more friendlier, and easier to get to grips with, than Windows....I teach people how to use Windoze (yuck!).

: I *do* like my ST, it's grown on me a lot, but it does have some serious disadvantages to a PC, as far as I can see.

Well I bought my ST while using PCs a LOT at work. I use it ONLY for MIDI work (running Cubase) and I call it my "Hardware Window." Running Cubase under Windows on a PC is fraught with problems but it runs just great on an ST so I keep my ST and use it ONLY for Cubase.

[Well actually I also run a few other applications but for serious, non-MIDI, work I use the PC].

I actually have a SPARE ST which I keep in work for testing any PD software I get off the net. It has been upgraded to 2.5Mb and has a 45Mb hard drive. I don't really need this machine but, unless I get a reasonable offer for it, I may as well keep it (for spares?).

I have seen 8 Mbyte memory expansion cards advertised in various magazines
(manufactured by Marpet, I think). These appear to only work with TOS 2.06,

and need to have 4 Mbyte already installed.

What's so special about the memory management in this TOS?

Would Mint be able to use this memory?
Would it be considered as "TT Fast Ram"?

No idea.....

: Would Mint be able to use this memory?
: Would it be considered as "TT Fast Ram"?

Yes, should be able to use with MiNT, and yes, it is addressed as TT
Fast RAM...so only progs that use TT Fast RAM will use this extra
memory.

I wanted to buy this board, too, however, I asked around, and found
that there were some bugs which needed to be sorted out. This was a few
months ago, and I haven't asked since. Also, as I have a Compo T-Board
68 Tos 2.06 upgrade for my STe, this board is not compatible with it,
and so I can not use it.

You are able to use it with the Bitz 2.06 upgrade, or even the one
available in Germany...the IDE board one...or if you onlu have 2.06 in
your Atari...

I need to switch coz I test software.

There are two extra GEMDOS calls, one to add the alternate memory to
GEMDOS (Maddalt()) and one to allocate memory from the alternate pool
(Mxalloc()). There is also support for extra bits in program headers
to make them automatically run and malloc from the alternate memory.

>
>Would Mint be able to use this memory?

Yes, Mint works fine. You are right, it would be 'fast RAM' as far as
GEMDOS is concerned.

No, tcsh does not need MiNT. I have occasionally run tchs
un my TT running TOS 3.06, nothing added. There are some
drawbacks, though, e.g. tcsh doesn't understand the cursor
keys without MiNT. You can still use ^P, ^N, ^B and ^F
in place of up, down, left and right, respectively.
Remember that with or without MiNT, tcsh alone is not really
useful, you also need a suite of file utilities (ls, rm, mv
and so on), as many elementary commands are not built into
tcsh.

:
: What's so special about the memory management in this TOS?

My understanding of this is that TOS 2.06 has the Maddalt()
function. This is missing in older TOS versions; it has been
introduced to add alternate memory, and the first, and largely
the only known kind of alternate memory is TT RAM. However,
other kinds of alternate memory can also be added, the expansions
you mention are one example.

: Would Mint be able to use this memory?

I would assume so, but check with the vendors to be sure.

: Would it be considered as "TT Fast Ram"?

It is alternate RAM. As far as I know, programs have no way of
telling whether the alternate RAM is TT fastRAM or memory on
some expansion card or other. Alternate RAM is different from
ST RAM in that it cannot be accessed by some hardware like the
shifter, the blitter or the DMA soundchip. This means that
programs may not set the physical screenbase to addresses in
alternate RAM or play sound samples from alternate RAM, for
example. Assumptions about the speed of alternate RAM are not
warranted unless the program measures the speed itself.

Pardon me for being obvious, but why not just buy the PC and have them both?
You can upgrade either machine as you need to. Multiple machines are the
best kind of multitasking :-). It is unlikely that you would get very much
money if you sold your ST system (or any fairly old computer system, for
that matter), so why get rid of all the time and software you have invested
in it? This would also take care of any uncertainty you may have about
"what will I gain and what will I lose".

PCs are handy to have around. I personally don't enjoy _playing_ with mine,
but they are undeniably useful from a utilitarian point of view. As far as
recreation goes, flight simulators are typically better on PCs (analog
joysticks, for one), arcade/action style games are typically better on STs.
I definitely have more _fun_ tinkering with my Atari machines that the
numerous PCs, Macs, Suns, RS6000's, SGI's, etc. that I am responsible for.
One should have the means to relax, after all :-).

Incidentally, another option is for you to purchase a Spectre Mac emulator
for your ST. Mac emulation opens up a whole world of software for your ST.
Of course, you could do this AND buy the PC (perhaps at different times,
if money is tight). You would then have some SERIOUS flexibility when it
comes to personal computers.

Just my $0.02.

>At present I have a 520 STFM with 1Mb RAM. 1Mb D/D. No HD, Mono Monitor,
>and .....wait for it.....TOS 1.02 (1.2).

Its not fair to compare this to even a 386/16. Also TOS 1.02 is not really
an good example of what TOS is like nowadays.

When I switch my STM back to TOS 1.04 it looks and feels painfully slow,
but most of the time I'm running a MSTE which as a nice turn of speed and
a decent TOS. It also has a hard disk which makes a big difference.

What you need:

1) Hard disk
2) TOS Upgrade
3) More memory
4) NVDI
5) CPU upgrade

(alternatively buy MagiC instead of (2) and (4).

Then it won't feel slow or inadequate - at least until you start playing
with fast 486 machines.

:-)

Roland.

Tcsh

It (version 6.0.03 - or something close) runs under MultiTOS or MiNT. Use
Gulam or NeoDesk CLI in other cases.

4476. TOS DOWNgrade?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-25 00:44:47 UTC
From: hopper_t@msupa.pa.msu.edu
Message-ID: <33gphv$qt6@msuinfo.cl.msu.edu>
Source record: 30753

Does anyone know if it's possible to hook up TOS 1.04 (or 1.062) in a MegaSTE which already has TOS 2.06? I realise that's probably an odd request, but I was thinking that for the sake of playing games, having an older TOS installed so I could switch between 2.06 and 1.0x before turning on the machine would be rather convenient. Would the TEC board w/o ROMs work?

Any suggestions would be welcome, but the cheaper the cost the better. :-)

Thanks,
Tom

: Jaap-Henk

I lost my F: partition twice before I figured out what was going on. You
are 100% correct about the problem: when one partition fills the
following partition's boot sector is overwritten.

You need AHDI 6.05c I believe. I found it on GEnie. I also think you have
to reformat the hard drive to install the new driver. My local Atari
dealer did it for me without losing any data. (They stored it on a 88MB
Syquest temporarily.)

I could not recover the data. Diamond Edge didn't even work with
restoring the boot sector. :(

Sam

ps If you can't find the new AHDI (or are extremely lazy :) I'll e-mail
it to you.

4479. Formatting/initialising a single HD partition

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-25 10:18:18 UTC
From: geert@ahold.nl
Message-ID: <4910@ahds.ahold.nl>
Source record: 30777
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi folks,

Currently I am trying to install MiNT one partition of my harddisk.
The partition I use, was originally used for Minix and had a Minix
filesystem on it. This is probably not the same as the minixfs
MiNT uses. With HDX program of ATARI you can zero one partition,
as I did after I failed to install MiNT on the harddisk partition.

HDX doesn't install a new filesystem on the partion I just zeroed.

So, finally, how can you format one partition of your harddisk and
create a new TOS filesystem on it?
Can it possibly be done by not formatting your entire harddisk
(and spending many hours/days to backup my entire harddisk's structure)?

Can anyone out there help me out?

Thanks in advance,

Geert Jonkheer.

There are versions of AHDI which will trash a partition if the previous one gets
full. Does this sound likely? try and get the latest version of AHDI from an FTP
site or from Atari. I don't know how you can recover your data but unless you get
the newer AHDI, it will happen again.

David White (dwhite@rd.eng.bbc.co.uk) wrote:

: I'm running a falcon, 4M, 120MB. What is the best cli to use? It needs to
: be of a reasonable size (ie, not big).

I use BASH 1.10. It runs easily within 4 MB, in fact, I've had three running at once. It is also possible to use BASH without having to switch to a non-GEM filesystem, if that's your preference.

: Also, is there any reason for
: toswin to grab huge amounts of memory when it is run? It isn't an
: important matter as I can use miniwin quite easily.

You can limit the amount of RAM grabbed by any MiNT process. Edit your MINT.CNF file (in /MULTITOS) and add the line
MAXMEM=2048
which would limit the grab to 2 MB in this example.

I eventually went to 14 MB of RAM because I found that I couldn't compile C++ with GNU C in 4 MB. There simply isn't enough space for the OS and the C++ compiler to coexist! Note that you can still use ANSI C; the size of that module in GCC is smaller.

Besides, when you add the extra memory, you can move $TMP to a RAMdisk; this really puts legs on the compile process. Add to that the speed boost you get from the screenblank in BlowUP, and your Falcon won't seem as slow!

: Also, is Mintos worth the hassle?

Absolutely! I would never have stayed with Atari so long (or bought my Falcon) if MultiTOS hadn't showed up.

Now, where's Xfree68 to put on it? ;-)

From: "S.J. Harrison" <S.J.Harrison@ncl.ac.uk>
Message-ID: <33i9hp$sat@whitbeck.ncl.ac.uk>
Source record: 30762

Has anyone successfully managed to use a Light Pen with the Ste? I have tried a number of designs connecting to the Fire0/LightPen input of the enhanced joystick connector A. I find that Y resolution is exact and stable to the nearest scanline, but I seem to get random values for the X coord. It doesn't even seem to follow a trend: i.e. values from far left to far right wherever the light pen is pointing.

Any help/advice appreciated.

4484. Monitor sync on the STe

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-25 14:27:12 UTC
From: "S.J. Harrison" <S.J.Harrison@ncl.ac.uk>
Message-ID: <33i9o0$sat@whitbeck.ncl.ac.uk>
Source record: 30763

I notice in the "STe addendum" slip provided with the normal ST manuals,
the monitor socket has two pins marked:
3: Clock select
4: Monochrome detect/Clock input

The shifter has a bit in one register to select external sync, so is it
possible to (easily) lock the sync to an external source fed through the
monitor socket? And if so, how?

Any comments appreciated,
Simon

|> Simon
|> Simon
|> --

The problem you are experiencing is due to the delay in time from when
the light pen is activated by the monitor sweep to the reading of the
X/Y values by your program.

You are probably using some sort of interrupt routine to read the X and
Y values. If your interrupt is of a high enough priority, a non-maskable
interrupt is the only way to go, you should never have a variation in the
Y value (unless you are at the extreme right hand edge of the display),
and the X value will be off by a rather consistent value.

The error in the X value will consist of the difference in time that it
takes for the graphics engine to 1) send a pixel to the monitor, 2) the
monitor to light up the phosphor, 3) the light pen to notice the phosphor,
4) the time to raise the interrupt, 5) the time for the interrupt to be
serviced by the CPU. In high resolution displays these dealys actually
start adding up to 10 to 20 pixel delays.

In 1983, at Sanders Associates, I worked out the calibration algorithms for
using light pens on high resolution (1024x1024) raster displays. That was
an interesting project and required that the calibration be performed on 5
different positions on the screen and the porper correction factor to be
applied based upon what part of the screen the light pen was.

Doing this for the STe would be interesting.

Brian

Source record: 30769
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

```
Hi,

I'm trying to learn assembler using some old ST Format issues,
an Atari internals book, and Clayton's Volume 1. A Molyneaux
listing from the ST Format does some initialization for VBI:
VBI equ $70
My thinking is that maybe this is a register, because later in the listing:
move.l VBI,old_vbi back up the old vbi
move.l #_vbi,VBI patch in the new one
bsr _main
move.l old_vbi,VBI
and so on. Most of what's going on is understandable to me, but
I was unable to find in my meager references which register $70
might correspond to, if indeed it is a register. Any suggestions?
Oh, this particular sequence is in supervisor mode.

I own an Atari 1040 ST and use it for sequencing using Cubase.
I really am interested in a Falcon 030 or 040 I just don't know much about
them. Could someone help me ? I want a falcon running Cubase audio so I
can do digital hard-disk recording- Can I use cubase to sequence and play
back digital recordings or should I use my other atari to sequence and run
recording software on a falcon?
- Do Falcon's have a Multi-Tasking operating system (Like AMIGA?)
- Does the Falcon have a Midi Interface built in like the ST ?
- Does the Falcon have IDE or SCSI interface supplied?
- Can I connect a SYQUEST or Bernoulli drive to the Falcon directly?
- Does the Falcon have good graphics? What kind of chips, resolution?
- Can it display multiple resolutions on the same screen (again
like AMIGA)?
- What does it cost ? Where can I get one? In Salt Lake the last
ATARI dealer closed a year ago.
- Does the Falcon really have 16 bit D/A A/D conversion for audio?
- Can I plug the Falcon directly into a VCR ?
- What will I need to do digital hard-disk recording?
...I want to be able to record lots of samples
or short tracks and assign them a place in my
midi sequence (trigger them) and then be
able to mix them down to one file that will
play all the samples on cue.
I appreciate any help on any of these questions, please respond by
E-mail to: Paul.Luscher@m.cc.utah.edu
even if you know of someone who could help, please direct me there! Thank-You.
-Paul

From: ljs@mits.mdata.fi
Message-ID: <33irg4$qv2@prime.mdata.fi>
Source record: 30771

(You asked about the VBI)

The address $70 (referred as VBI) contains the address of the Vertical
Blank Interrupt routine. This routine is executed every time the beam
(which draws the picture on your monitor or TV) reaches the down right
corner of the screen (in ST-low 319,199).
In ST the routine is executed 50 or 60 times per second (I don't know
about the Falcon).

In GEM the VBI is responsible for turning off the disc drive lights (and
motors!! 8-)) and some other nice stuff.

What is it used for? Well, if one wants to have flicker free graphics
when using sprites one should do the screen swapping just after the VBI.

I certainly hope that this message helps you!

You might try looking at one of the recent issues of ST Applications, in
which the Programmer's Forum article describes a light pen system using the
STe's extended ports.

On a related note, does anyone know what exactly you are meant to connect
to the analogue inputs of the ports to build a paddle controller? Connecting
a potentiometer straight across them doesn't seem to work, as it is too
erratic and 'pins' to 0 or 255 far too easily. Anyone got a schematic of a
paddle controller?

$70 is the address of the vertical-blank-interrupt trap vector: the longword at that location points to the interrupt handler. The 68000 uses the first 256 longwords (only the first 80 or so are meaningful on the ST) for trap vectors: some for faults (bus error etc.), some for external interrupts, and $80-$bc for the trap instruction (trap #0..#15).

You've got to be kidding! Windows is utterly slow and even the humblest ST running in mono way outclasses it in terms of speed. You really should get a HD though, you can't seriously compare a system with a harddrive and one without...

KW> The screen resolution is not as good as VGA. (Mono Hi-Res is great,
KW> but it's MONO !)

True... but the picture-quality is much better at the pixel-perfect super-smooth 72Hz compared to VGA's 60Hz...

KW> The ST system font makes me feel ill. I wish I could change it for
KW> something like the PC standard one.

Oh come on! I do hope your not stupid enough to switch computer on account of the system font it uses!

KW> The keyboard is terrible to type on, it's ok for pressing the odd key,
KW> but not for serious work.

I agree! There are adapters around (I think one is called ST-Tast) that let's you use a standard PC-keyboard...

KW> No HD

Get one!

KW> Advantages of the ST compared to the PC
KW> ======================================
KW>
KW> It has MIDI ports.

It uses GEM which is both easier, faster and more reliable than Winslows... You can buy NVDI to get speed even more way out of Winslows league (and you can also change the system font ;-))

It doesn't cost any money to stick to the computer you have...

You don't have to buy a new computer every other year because the old one is just too damn old fashioned...

As for upgrades:

A HARDDRIVE! (This one is essential, the others aren't)

NVDI - You won't believe the speed...

16MHz accelerators....

68030-accelerators...

4495. Re: More memory above 4 Mbyte limit

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-25 22:58:35 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <Cv455o.KH8@cix.compulink.co.uk>
Source record: 30774

>: Would it be considered as "TT Fast Ram"?

I think the situation is that it would be *considered* to be TT Fast RAM, even though it is not necessarily any faster than ST RAM, and no assumptions can be made about whether it is 16 or 32 bits wide. Actually it doesn't matter as far as the ST is concerned. RAM is either ST RAM (and hence accessable by all the custom chips), or 'alternative' which is only accessable by the CPU.

:-)

Roland.

@CiX

PS All comments based on the Marpet XtraRAM +8 expansion board - as this is the only non TT/Falcon 'alternative' RAM board I know anything about.

4496. Linux running on a Falcon, can it be done!

Newsgroup: comp.sys.atari.st.tech

From: h8ip021@stan.xx.swin.OZ.AU
Message-ID: <33jcgoINNhjs@edna.cc.swin.edu.au>
Source record: 30775

Hi.

I have just downloaded the binaries of Linux from ftp.uni-muenster.de and have tried running it on my Falcon. Now it sort of goes, starts up, goes into the unix-font-mode, probes my floppy drive, and then burps, gives me a list of the 68030 registers, says something like
kernel panic
swapping mode not syncing

Just wondering if anyone has got it up and running yet, and what am I doing wrong. (Running it with -r ramdisk.img or whatever doesn't work either.)

Thanks,

Karl.

4497. Advice Please - St Upgrad

-> I'm toying with the idea of getting a PC. (Arghhhh, ouch, oohh, stop
-> it !, ok,

It depends on what software you like using. If you are using Cubase, Its the same program on all platforms. Notator SL doesnt exist on any other platform, nor is there anything remotely like it on the pc. In fact, having examined what software there is available for midi on the pc, its really lacking. Programs written on the Atari years ago are still quite superior to whats available on the pc.
I would advise you to go out there and examine what software there is, whether it has the crucial features you need. If you find something, go for it. Otherwise-wait. Notator Logic for the pc is still being developed, and in the next year or so some good sequencers may become available.
regards,
Tom

4498. Monitor Sync On The Ste

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-26 03:52:00 UTC
From: tom.feuerstake@f422.n250.z1.tor250.org
Message-ID: <6f0066b5@f422.n250.z1.tor250.org>

```
-> I notice in the "STe addendum" slip provided with the normal ST
-> manuals, the monitor socket has two pins marked:
-> 3: Clock select
-> 4: Monochrome detect/Clock input

Well, what I know is, a monochrome monitor will apply a ground to the
monochrome detect input, and cause the st to boot in high rez mode,
which is identical to monochrome vga. In fact pretty well any vga
monitor can be used for high rez mode if you adapt the cable.
Regards,
Tom

4500. ExtenDOS Patch to v1.21 now available at HENSA

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-26 11:11:08 UTC
From: vctec@westminster.ac.uk
Message-ID: <Cv533K.JDM@westminster.ac.uk>
Source record: 30788
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

```
From pddanny@uk.ac.hensa.micros Fri Aug 26 12:02:14 1994
Date: Fri, 26 Aug 1994 12:01:18 GMT
Subject: EXTENDOS PATCH Update older versions of ExtenDOS to 1.21

It's online as file micros/atari/tos/o/o095/edos_121.lzh

This patch updates Anodyne Software's ExtenDOS package to
version 1.21. After applying this patch, you will have the
following versions of these ExtenDOS modules:
CD.BOS 1.6
EXTENDOS.PRG 1.4
TRACE.TTP 1.6
UNIDRIVE.DOS 1.5
UNI_BDDS.DOS 1.5

NOTE: All users of ExtenDOS version 1.20 should apply this patch
since it fixes several significant problems in version 1.20.

We also strongly recommend that all users of ExtenDOS v1.0, v1.1,
and v1.11 apply this patch.

This archive contains the following files:

PATCH121.TOS Patches the main ExtenDOS modules
CHECKIT.TOS Checks the patched files
CHECKIT.CTL Control file for CHECKIT.TOS
TRACE.TTP Replacement for existing TRACE.TTP
READ.ME Important documentation on version 1.21
READ_ME.1ST

New Features:
* PhotoCD Support (single and multisession).
* All known problems and incompatibilities have been fixed.
* Boot up messages now readable on a 40 column screen.
* UNIDRIVE.DOS now detects certain errors in the path table of a CD-ROM, and
automatically uses the alternate path table.

Bug Fixes:
* PhotoCD now works correctly on a Falcon
* NEC25 drive now handled correctly
* Path tables larger than path buffer now handled correctly

File size: 80896

It's online as file micros/atari/tos/o/o095/edos_121.lzh

HELP HELP.... AUTO OVERSCAN....!!!!

This is now my 3rd posting regarding how to upgrade
my version 3.0zh of Overscan to the latest version,
I was informed that its now 3.0zm..??

Or is there version 4.x ???

Can some one please help me, I did e-mail to Compo UK and recieved no reply,
another person told me to contact Karsten Isakovi'c..

Karsten did respond to my first posting and gave me the latest version number,
but he is no longer invoved, with this program or was it Overscan..

If this is the kind of support you get with German software, never never again
will I recommend German software to any one....

I have allready got my fingers badly burnt by buying Script, so I should have
known better...

Why can't Overscan do it the same way Michael Ziegler does it with GSZRZ,
and use a BBS for support, at least Michaels system works, and is simple and
not that expensive...

So Please support you users...!!!!

What is the base address of the Fast Ram (or TT-Ram, I don't know the exact term) ? I saw in the file hardware.txt (on a.a.u.e) that this extra-ram is located above the 16Meg limit (so this would be be only accessible by a 68020 or 68030 CPU); has anybody got infos on that (TOS version, addresses, etc...) ?

4504. Re: booting a MEGA4 from floppy?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-26 14:21:04 UTC
From: A.G.Haigh-Hutchinson@bradford.ac.uk
Message-ID: <1994Aug26.142104.28762@bradford.ac.uk>
Source record: 30781

Just a short missile - Is there anyone out there know where I can get an internal hard drive for my MEGA4 ST? - if so, because I cannot afford the price of a 'new' external hard drive + cabling, please post me details.

Further to that - does anyone use the Zydec 3.5" FDD connected to a MEGA4 - and is it any good - I have read the blurb but I want to hear it from users !!

That's all for now

Adrian

Compo UK have 3.0zg so your ahead of them! They are not expecting an update at the moment but said when/if it's updated, you can get the new version for a nominal fee ie a blank disk and return postage. The email address you should use is compo@cix.compulink.co.uk - that *should* get you a reply.

David White (dwhite@rd.eng.bbc.co.uk) wrote:
:
: Has anybody gat an example tcshrc.csh file that they could send to me? I
: can't seem to get mine to work properly.

Could you please describe your problem with tcsh.rc in more
detail? Sending you a version that works on some other Atari
probably won't help you much, as quite a few things in tcsh.rc
have to be done in an installation-dependent manner. As far as
my experience goes, the tcsh.rc that comes with the tcsh archive
"works", i.e. it doesn't cause any weird messages or crashes.
You have to adapt it to your local environment, though.
Perhaps the problem isn't with the contents of the tcsh.rc
file even. E.g. if tcsh seems to ignore the tcsh.rc file altogether,
you may need to fix the setting for the HOME environment variable
at the time you start tcsh.

: them. Could someone help me ? I want a falcon running Cubase audio so I
: can do digital hard-disk recording- Can I use cubase to sequence and play
: back digital recordings or should I use my other atari to sequence and run
: recording software on a falcon?
: - Do Falcon's have a Multi-Tasking operating system (Like AMIGA?)

Yes, MultiTos. Its kinda slow but, MINT 1.11 binary should speed it up.
You can also get Geniva or MagiC.

: - Does the Falcon have a Midi Interface built in like the ST ?

Yes.

: - Does the Falcon have IDE or SCSI interface supplied?

Both. IDE is internal 2.5 inch and the SCSI II is external.

: - Can I connect a SYQUEST or Bernoulli drive to the Falcon directly?

Yes, through the SCSI II port.

: - Does the Falcon have good graphics? What kind of chips, resolution?

Too many to mention. I would recommend a VGA monitor for the type of
work you are doing. You can do 640x480 in 2,4,16, and 256 colors.
320x200 in 16,256,65536 and 320x480 in 16,256,65536 ..... The desktop
is also in color with color icons.

: - Can it display multiple resolutions on the same screen (again

You can, but you (the programmer) need to do some programming tricks. I
dont think you will find it important for the type of work you are doing.

: - What does it cost ? Where can I get one? In Salt Lake the last
: ATARI dealer closed a year ago.

You can order it from STeves Sales or Toad or ATY. There are others as well.

: - Does the Falcon really have 16 bit D/A A/D conversion for audio?

Yes, it does. Not quite the quality of a pro unit that costs $1500 or
more for the convertors, but for me very good quality (make sure that the
bass boost circut is clipped when you purchase it. :) Helps the quality.

: - Can I plug the Falcon directly into a VCR ?

Yes, Out of the box with RF. Although I reccomend you use the composite out that is in the video plug pin 12. If you plan to do video, you need to be in RGB mode. VGA mode does not work well on TVs. I have a used Multisync II and Multisync Gizmo switch to change between RGB and VGA. The monitor must handle 15k horizontal to 31+k horizontal to work in RGB and VGA.

: - What will I need to do digital hard-disk recording?

A Falcon, Cubase, and a really big hard drive.

vince

Newer ports of `tcsh' need MiNT. However, there is an old port of
tcsh 6.01 (I think) by Eric Smith which should also work under TOS.
It should still be available from atari.archive.umich.edu.

I bought a Zydec floppy drive once, but it only worked for a few days
before it started destroying my floppies. The annoying thing was it took
three separate attempts to take it back to Evesham Micros where I bought
it from to get them to admit it didn't work!!

In the end I gave up and got a hard disk instead.
One hard disk is *much* better than two floppy drives.
I have a SH205 20mb hard disk which is still going strong, albeit a bit
slow. :)

Note I am *not* saying that all zydec drives are crap. Just my particular
one. Also not everyone at Evesham is incompetent. (just one or two...)

: Timothy Miller (millert@grad.csee.usf.edu) wrote:
.....
: >Pardon me, but I actually did this and learned the hard way what the
: >GEMDOS concole calls to not call the BIOS through the trap vector. I
: >redirected only the BIOS and found that NONE of the GEMDOS calls were
: >being redirected. I ended up having to do it myself.

: Are you *absolutely* sure about this?
: I just booted up a copy of TOS 1.0 and checked this using SysMon;
: the result:

.....

: Here, GEMDOS is *obviously* using the BIOS trap!
: The same is true for TOS 1.04, and I don't see why TOS 1.02 should
: behave any differently (I don't have a loadable TOS 1.02 available,
: just an ancient set of ROMs somewhere...8-))

Hmmm... I'm sure I had problems with Cconws and Cconrs. I'm not so sure
about the others.

: (No, I diddn't check if *all* GEMDOS console output functions
: use the BIOS trap; but at least one other GEMDOS call, Crawio(),
: definitely does so...)

: Couldn't there be another explanation for your problem?

It's possible that only Cconws and Cconrs had problems with this.

Do Fread and Fwrite call BIOS?

: For example, what if your BIOS trap handler had a bug that prevented
: it from working correctly if called from *Supervisor Mode*?
: (You *did* have special case handling for this, didn't you?)
: Most user programs run, well, in User Mode, whereas GEMDOS runs
: in Supervisor Mode - a bug like this could very well have the effect
: you described...

Yeah, there was a special case for supervisor mode. I looked at "Atari
ST Internals" listing of the BIOS and saw how it handled the trap and
just imitated that for my own purposes.

: It does. Just get a copy of SysMon and check it yourself.

Well, assuming that there are only problems with a couple of the calls,
OR something like Warp 9 was intercepting the calls and giving me

problems (which I hadn't considered until just now), what do you suggest that I do about it?

What I ACTUALLY did was trap GEMDOS and when it was a console function, I just had my own code to perform the same function (with a little added functionality in a few places. :)

4519. MultiTOS running programs

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-27 02:51:05 UTC
From: millert@grad.csee.usf.edu
Message-ID: <33m9mp$l2v@mother.usf.edu>
Source record: 30700

If you run the same program under MultiTOS more than once, does it use the same code segment for all instances of the program?

If not, what would I need to do to write a program that could be made to run in multiple instances?

4520. What am I? (Chip ID required)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-27 05:04:11 UTC
From: avesperm@powerup.com.au
Message-ID: <33mhgb$moh@grissom.powerup.com.au>
Source record: 30701

I live on an Atari STe Motherboard.
I am square.
I have 44 pins. (ish)
I am attatched to an 8Mhz xtal.
I am marked with an atari logo.
I am designated C398789-001.
I am under the floppy drive.
My motherboard is a _very_ late revision, just before Ajax
chips became standard. Perhaps I am one.
There is no 1772 chip on the motherboard.

Any ideas that might solve my identity crisis? Please email.

Dancer (as the chip cannot type)

4521. Atari--->Mac file conversion

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-27 07:13:01 UTC
From: drewmack1@aol.com
Message-ID: <33mp1t$3q5@search01.news.aol.com>
Source record: 30702

I had been working with a partner using E-Magic notator. As often happens, my partner and I have parted company. He parted with the Atari and I parted with the disks.
I now have all of this music, that I really need to access so that I can do something with it, and I have a Mac IIci. I am using Opcode Vision now and I need to know if there is any way to translate the files from Atari to Macintosh format.(even if you know of a way to convert it to a DOS environment would be very helpful)
Please send E-mail

HELP!!!!!
Thanks,
Drew Mack

4522. Scanners for Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-27 09:57:24 UTC
From: Daniel Cohen <D.E.Cohen@qmw.ac.uk>
Message-ID: <33n2m4$a68@beta.qmw.ac.uk>
Source record: 30703

I have a Daatascan A4 scanner which worked fine with my ST but misbehaves on my Falcon (even with resolution set to ST High, 8Mhz, cache off). This scanner is sheet-fed by a roller-driven base, and the sheet simply stops in the middle of a scan (most of the time with resolution of 300dpi, occasionally with resolution of 200dpi).
So far, I've had the following diagnoses of the problem:
1) The Falcon cartridge port is different from the ST's (Atari say it's the same, my informant insists that it's not). Unlikely, I think, as the program works some of the time.
2) It's an interrupt problem. Quite possible, but it doesn't help me.
3) Andy Pennell, who wrote the program for the scanner, was kind enough to send me several revised versions, one with timing tweaked. But this didn't solve the problem. He also said "If the Falcon has a cartridge cache (the TT doesn't) you will need to switch it off". Does anyone know if the Falcon does have such a cache, and if so how to switch it off.
4) Pandaal, who originally sold this scanner (they still exist, but on a very small scale; I haven't been able to contact them lately) suggest that maybe a stronger power supply is needed for Falcon use. They suggest going for 15volt 1.5amp (the original power supply is 12volt 1 amp). Apart from the difficulty of getting such a power supply, I am concerned that it might damage the Falcon if used. Can anyone say about this?
I would be interested in any suggestions about solving the problem. I would also be glad to have information about other A4 scanners for the Falcon, and what people's experience is of them.
By the way, I'm told that the Daatascan software for hand scanners works fine on the Falcon.
This is my first posting to the newsgroup; I would welcome comments as to whether this or comp.atari.st is the right one to post to, or should I post to both.

4523. Re: 68030 in 1040STe - what's needed?

I think the "RC16" stands for 16 MHz...

There is an accelerator board called "PAK 68/3" that fits the 68030 and
68882 into an ordinary ST. You will have to upgrade your TOS to at least
2.06 to be able to use the 32 kb cache of the PAK. If you want the PMMU
capabilities of the 030 to work, you must have at least TOS 3.06...

So, it will cost you a few bucks, but then you'll have the fastest ST
you've ever seen.You can probably run the chips in 32 MHz if you
supply a little cooling...

If you want addresses to the companies that sell the PAK 68/3, contact me!
(The only sources of the accellerator taht I know of, are in Germany and
in the UK, though...)

Good luck!

4524. Re: Monitor sync STe / VGA on STs

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-27 12:03:33 UTC
From: e2daka5@etek.chalmers.se
Message-ID: <1994Aug27.120333.21256@etek.chalmers.se>
Source record: 30705

The VGA screen has a fixed 70 Hz vertical sync frq, wich makes it hard
to use (w/o modification) on an ST (71,25 Hz in Hi-res, 50 or 60 Hz in low/mid).
I use a VGA screen in Hires, but I had to open it and turn a lot of trim
potentiometers before I was able to seeanything at all... The border also
turned out to be rather thick, but since I got the screen for free, I thought
it was worth a try.

Another thing worth noticing: the composite video signal from the ST was so
strong, I had to connect it to the VGA via a 33 ohm resistor...

If anyone wants the pinouts, just reply to this article...

Good luck!

4527. Fast byte swaping!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-27 19:22:28 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <Cv7KHx.LwD@beaver.cs.washington.edu>
Source record: 30708
Cross-posted to: comp.sys.m68k,comp.sys.atari.st.tech

Does anyone know how to swap the two bytes in a word any faster than:

```
ror.w #8,d0
```

Rotations are just so slow. If there is a faster way on the 68030
than on the 68000, let me know as well.

Thanks,

Stuart Denman

I will mail you my Tcshrc file, it is for version 6.03.3 and works only with MultiTOS. I have used my TT tcshrc file for use with the UNIX 6.03.4 version and it worked with modifications for path only!

Send me mail asking about the file and I'll reply with my tcshrc file, it should also work with any older version of tcsh.

I see you're working on your GIF decoder. ;-)
It's interesting that such a simple piece of code can be improved so
drastically with some work...

A long time ago, I read somewhere that a byte swap could be done faster if
you use the following strange feature:
move.b d0,-(a7) d0.b = nn
move.w (a7)+,d0 d0.w = nnxx
I've never timed any code using that trick, but I don't really believe it's
faster.

For a GIF decoder it can be a good idea to turn the entire file inside out
and then index from the back. When the decoder in MGIF was still written
in C, that was a great improvement. It still might be useful in assembly
for a 68000, but I can't verify that on my Falcon, unfortunately.

The '030 has a barrel shifter, so the ROR will only take a few cycles. I
don't know the exact number, but I'd guess 2-4. There is no faster way.

> Does anyone know how to swap the two bytes in a word any faster than:
> ror.w #8,d0

I don't need to swap bytes, but I need to move the high byte of the word (d15..d8) to the low byte of another register, so I do something like:

```
move.w d0,-(a7)
move.b (a7)+,d1
```

This works because the processor treats a7 specially when used in auto increment and decrement modes. Even if you specify a byte transfer, it adjusts a7 by two.

So perhaps you could do this:

```
move.w d0,-(sp) ; push H, L
move.b d0,(sp) ; push L
move.w (sp)+,d0 ; pop L, x
move.b (sp)+,d0 ; pop H
```

On a 68K with both instruction and data cache hits but no barrel shifter, this might be faster than the ror.w instruction.

The other thing you might do if you are running on custom hardware is to wire up a byte swap location with a pair of 74x244s.

Another possibility which I'm told is used for bit reversal in some versions of Adobe PostScript(tm) is to have a 128K byte table.

Cheers,
Eric

4533. Help: Minix & GCC

No, if you wan't to get the joystick position, you have to install a short assembler routine in the joystick vector which you get with Kbvbase(). It returns a pointer to a structure with the vectors for mouse handling, joystick handling etc. TOS only uses the mouse handler. If your BASIC has no build-in function for that, there is no way of doing this in simple BASIC.

Unfortunately, I don't know of any sort of stand-alone program (Atari OR Mac) that will do a conversion of the Notator .SON type of file. In fact, the only thing I can think of Mac-wise would be getting the E-Magic LOGIC sequencer for the Mac - that can load the older .SON and can save again as Standard Midi File 1, which I'm sure Vision can take. The only problem there is that you'd wind up with two sequencers.

The best advice I could probably give - try to find someone who has an Atari or a Mac which runs Logic and spend an evening converting the files. Or, phone up Ensoniq (EMagic's US distributor) and see if they can give you some advice.

I just hacked up the following small test program:

#include <tos.h>
#include <string.h>

main()
{
char str[80] ;
long len;

Cconout('E') ;
Cconws("nter a line:\r\n") ;
str[0] = 79 ; /* maxlen */
Cconrs((LINE*)str) ;
Cconws("\r\nYour input was: ") ;
Cconws(str+2) ;
Cconws("\r\n") ;

Fwrite(1, 15L, "Enter a line:\r\n") ;
len = Fread(0, 79L, str) ;
```

```
if ( len > 0 )
{
Fwrite(1, 18L, "\r\nYour input was: ") ;
Fwrite(1, len, str) ;
Fwrite(1, 2L, "\r\n") ;
}

/* wait for two keypresses */
Cconin() ;
Crawcin() ;
/* this one doesn't wait: */
Crawio(0xff) ;

return 0 ;
}
```

The result after some testing with SysMon:
all GEMDOS functions I used call BIOS functions to do their work,
including Cconws and Cconrs...

>: (No, I diddn't check if *all* GEMDOS console output functions

>that I do about it?

I *think* that Quick ST/Warp 9 is the culprit - it speeds up
GEMDOS screen output by intercepting Cconws (and possibly Fwrite).

You could try the patch program "CONS_FIX" (Utilities/cons_fix.lzh
on a.a.u.e), which is supposed to disable Quick ST (and its European
pendant Turbo ST) for GEMDOS output *if* the console xconout vector
(present since TOS 1.02) was changed by some other program (I don't
know wether it works with Warp 9, though).

(This patch was created when it turned out that the Gemini desktop's
output redirection in the Console Window didn't work if Turbo ST/Quick ST
were installed - sounds familiar... :-))

(NVDI already has the equivalent of this patch built in; in addition,
GEMDOS screen output acceleration can be turned off in the config ACC.)

I'm using a 486DX50 at work with a 20" monitor 1280*1024 at 256 colours (rather exelent graphics card:-) and 16MB of RAM. With this configuration windows is usable but no fun or efficient to use. And when I realy want to do some multitasking Windows realy shows off its true uglynes.

And when it comes to userinterface, GEM programs REALY has the edge, most because of experienced WIMP programmers, but also because Windows seems too clutter up the screen with a lot of pretty, but useless gadgets. Very often I find myself deep down in level 5 - 10 of dialogs before the desired parameter can be accesed, and by that time the screen is so cluttered that I hardly can see what I'm doing. On my TT with 19" 1280*960, MTOS (Mint 1.11/AES 4.1) and 24MB ram, I really have to run 10 - 15 app's to make the screen remotly look that cluttered, and even with so many app's running they still do RUN (Realy:-)

As a final point: The same 486DX50 machine running Linux and X1.11 is like unleashing a mad dog; everything seems to run like h.....

>I was unable to find in my meager references which register $70
>might correspond to, if indeed it is a register. Any suggestions?
>Oh, this particular sequence is in supervisor mode.

The $70 is a interrupt vector, in fact it's the Vertical Blank Interrupt
(VBI) vector. By modifying this one it can point to your own piece of code
which is executed immediately after the Vertical Blank (screen refresh)
occurs, it is mostly used to synchronize a piece of code to the screen
refresh to avoid flickering effects.
On a RGB monitor your program will then be executed 50 times per second (or
in the USA, 60 times per second)
The last line restores the vector before exiting the program.
The code MUST be executed in supervisor mode as the vectors are in protected
memory (and they should be).

>low and med rezs.

It might work, as the QL used quite standard frequencies. The only problem
that can be found is that the color inputs are TTL only, then you can't get
the complete pallette of the ST (only 8 colors, with all colours set to
their highest values)

Maybe you can construct a cable first and try it out.

Good luck,
Gert

4543. MX15F monitor troubles...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-29 06:32:36 UTC
From: jbaumgar@bronze.coil.com
Message-ID: <33rve4$hoj@bronze.coil.com>
Source record: 30725
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a rather strange problem with my Mag Innovision MX15F monitor.
My display likes to slowly drift to the left, one pixel at a time, until
it finally reaches as far as the monitor will go. It appears as if it is
actually affecting the buttons on the front, because the monitor acts as
if H-PHASE (5) had actually been pressed.

There are two ways to fix this problem: 1) phase the display completely
to the left and then correct it with BLOWUP. This creates an undesirable
output. 2) keep the h-size (7) at a bare minimum. This takes about 2"
off of my 15" monitor, another undesirable thing.

Anyone have any ideas what's causing this, or does anyone have the number
of Mag Innovision so I could call them? It's not in the manual.

Thanks!

> move.b (sp)+,d0 ; pop H
>
>On a 68K with both instruction and data cache hits but no barrel shifter, this
>might be faster than the ror.w instruction.

There isn't such a puppy. Only the 68000/68010/68012 don't have some sort of shift acceleration - and they don't have a cache either.

On a 68000, the ROR will take 6+8*2 = 22 cycles, while the four moves are at best 4*8 = 32 cycles. On a CPU32, the ROR is 6 cycles, while the moves are at best probably 4*4 = 16 cycles. In both cases, the ROR wins.

The shift timing for the 68000/010/012 is 2 cycles per bit in addition to the base instruction time.

Examining the shift timing for CPU32, it becomes obvious that it can shift 8, 16, and 32 bit values by 0, 1, or 4 bit positions per cycle. (9, 17, and 33 bit wide values (i.e. ROXd) can only go 0 or 1 positions/cycle.) The base timing for static counts provides 4 shift cycles while dynamic counts provide 3 cycles in the base instruction time. Extra shift cycles always come in pairs. (Note that SWAP looks likes it might be implemented as a ROd.L #16,Dn based on its execution time!)

The shifter in the 68020 and 68030 looks like it can only do LSL and LSR directly. Anything else requires extra passes through the shifter. (This applies even for ASL - which must check all bits shifted out to detect overflows.) For the best performance, use the simplest shift that would work for you.

As to the original question - there is no faster way if that is exactly what must be done. There are some tricks that may go faster, but they involve algorithm and data format changes. Without more information, none of them can be recommended.

I have just a couple of things to add to the previous reply.

Paul Luscher (pl4266@u.cc.utah.edu) wrote:

: - Do Falcon's have a Multi-Tasking operating system (Like AMIGA?)

There are two more ways to speed up MultiTOS. One is NVDI, which replaces the VDI code with optimized equivalents. A very worthwhile improvement, from what users are saying.

Another way I've found to speed things up is BlowUP. More to follow.

: - Can I connect a SYQUEST or Bernoulli drive to the Falcon directly?

I have two SyQuest 88s, and two Quantum 105s (got them cheap) on my SCSI II port. They work flawlessly.

: - Does the Falcon have good graphics? What kind of chips, resolution?

A product called BlowUP lets you increase your screen resolution significantly if you have a multiscanning monitor. I tend to keep mine at around 900x700 with 16 colors most of the time, but can increase it past 1024x768 to look at large images and DTP work. You can also increase the colors and have lower resolutions, but then things slow down (16 MHz is barely enough for this). There are faster processor upgrades out now.

BlowUP also has a screensaver mode that disables the Falcon's video, and allows a significant increase in speed (30 to 40%, depending on mode). I notice that when I'm compiling or compressing, disk access seems considerably faster when the screen saver is running. This is handy for non-interactive work.

There is a software version of BlowUP, and two hardware versions. I recommend the software one, unless you have a new multiscan with 50 MHz bandwidth -- then BlowUP Hard II is useful. Hard I hasn't been much help for my slow Acer multiscan.

> Stuart Denman

Nuisance innit? Why didn't Motorola implement swap.w and swap.l (to match ext.w and ext.l)? Haven't got a 68k reference (and memory access considerations will also affect this), but try the following:

```
.
.
move.w d0,store
move.b store+1,store+2
move.w store+2,d0
move.b store,d0
.
.
store:
dc.l 0
```

Instinct says this should be slower, but I've been coding RISCs for the last few months. On a vanilla 16-bit ST this might have the edge. There is of course the option of creating a 128k lookup table containing pre-swapped copies of all 16-bit patterns...

```
.
lsl.w #1,d0
lea table,a0
move.w (a0,d0.w),d0
.
```

Hi Jim!

I have the MAG 17" MX17S Innovision, and there are no such problems with
it. I'm using Screenwonder Pro as a resolution enchancer.

If this shifting does NOT happen when BLOWUP is inactive, then replace
your software (the BLOWUP is capable of doing such harm - my Screen-
Wonder Pro started once to alter Fine Hor. Sync. setting on it's own
and the only way to get rid of it was to re-install the whole software).

If is not the the BLOWUP's fault, then I advice you to go to the shop
where you bought it and get the button electronics or membranes
replaced.

Do NOT open the monitor as it has very strong currents inside even it
is unplugged.

Hope you get it fixed!

I finally got fed up this summer of finding that PC disks no longer worked after being used on my ST. Brief examination of the boot-sector with Norton, before copying one from another disk, showed they had somehow become ST executable, though I swear there was no way the disks I was booting from could be infected. It was the Ghost virus for the xth time but before I wiped all my boot-sectors again I did a complete disassembly of the virus.

This showed that (apart from having become corrupt in two places - the bit that does the mouse swapping - explaining a recent bout of random crashes) it was using a technique to install itself I haven't seen documented anywhere. After disassembling most of the boot portion of the TOS ROM I have the following:

After performing all initialisation, running boot-sectors, cartridge apps etc. TOS gets _phystop, then counts backwards to $400 in $200 byte decrements, searching for blocks with a given header and checksum, then executing them. Ghost uses this to gain a foothold in RAM before any memory services have been started, and to ensure it is executed once after the resvector chain has been called so that it can reclaim resvector.

Does anyone know what this facility is for and the correct way to use it? As far as I can see cartridge apps and boot-sector code that need services not available when they are first run could use this method but what is the Official reason for it?

John

Well, it's the season for Atari problems around here! I just recieved a call from my father who described the following problem to me;

He turned on my Sister's 520stf (2.5megs ram), and instead of the normal sreen what came up was (and I quote;-) "something that looked like a TV with bad vertical hold! So, he turned everything off, and then checked the connections, and now nothing comes on, not even the little green light. However, he says he can still hear a 'slight humm' from the monitor... I just used this monitor myself last night...

So, he tried the Color monitor, and *lo, it haseth the the same vertical problem*;

Is the ST powdered toast?
Did my sister spill coke it in?
Can Lassie save the day once again?
Or is this finally the end?

Tune in next week for the chilling conclusion!

(Any advice would be greatly appreciated!)

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"To my mind the most frightening book ever published is Lewis F. Richardson's 'Statistics of Deadly Quarrels'. You've probably never heard of it even though its relevance to the mess you're in is at least as great as that of Darwin's 'On the Origin of Species,' which you learned about in fourth grade. And that's because it's so completely terrifying only those 'experts' who are adequately armoured with preconceived contrary ideas which will enable them to disregard Richardson's work completely ever get to study it."

The idea seems to be to look for a "boot sector" in a ramdisk, but the
implementation is rather strange, since restartable ramdisks want to live
above phystop. The technique I've seen is to install a reset vector which
when executed creates one of these things somewhere in the middle of memory
(i.e., low enough to not be part of screen-blanking).

The CPU32+ can be configured with cache, in which case it is called a CPU030.
One of the newest 683xx parts (maybe the 68349) does this.

It was none other than Kevan Winch that wrote on 23 Aug 94 that ,
KW> Drawbacks of the ST compared to the PC
KW> ====================================
KW> TOS is *awful*, compared with Windows, it really is out of the
KW> ballpark. It is SLOW compared to Windows, even on my 16MHz 386.

You are using a 7 year old version of TOS though !!! And since you have a none HD ST and you compare it to a HD PC .mmmmhhh.. There are certainly many reason's to be thinking about getting a PC but I don't think any objective viewpoint's will put Windows down as a reason to !!! Try to find someone who can show you TOS 2.06 or better still TOS 4.0x to see the large strides TOS and GEM have made in the meantime.

also get NVDI ,that;ll speed up the graphic functions on your machine by about 400% and its only about 30 quid ...it'll also replace the screen font if you require (You said something about that?)

As far as other upgrades to your ST may I suggest you consider getting a Falcon instead ...probably work out cheaper in the long run and will give you some improvements that no ST upgrade can give you.

|> Oh, this particular sequence is in supervisor mode.

$70 is NO Register, it is a Interrupt-Vektor!
The first 256 LongWord of the Memory ($0-$100), are Interrupt-Vektors.
Some are fixed CPU-Vektor (i.e $10 for "Illegal Opcode")
Some are pereferie-Vektors. $70 ist the "Vertical blank Vektor"

That means: At Each VBL (SM 124: Each 1/70 Seconds) the Code, to wich $70 points (in vour Example _vbi) is called.
ATTENTION: The Interrupt-Mask MUST set below 4! The Code MUST end with "RTE", Cause the CPU does NOT compute a normal JSR!

: Instinct says this should be slower, but I've been coding RISCs for the last
: few months. On a vanilla 16-bit ST this might have the edge. There is of
: course the option of creating a 128k lookup table containing pre-swapped
: copies of all 16-bit patterns...
: .
: lsl.w #1,d0
: lea table,a0
: move.w (a0,d0.w),d0
: .

That wouldn't work. It would shift out the most significant bit.
You would have to do like this:

moveq #0,d1 ; Makes sure that the high word is clear.
move.w d0,d1 ; Copies the low word from d0 to d1.
add.l d1,d1 ; Faster than lsl.
lea (table),a0 ; Table address (only positive offsets this time.
move.w (a0,d1.l),d0 ; (Or whatever register you want it in.)

High word of d0 remains unchanged.
Before: d0 = xxxxxxxx xxxxxxxx hhhhhhhh llllllll
After: d0 = xxxxxxxx xxxxxxxx llllllll hhhhhhhh
(x = unchanged)

Another option is this:

and.l #$0000ffff,d0
add.l d0,d0
lea (table),a0
move.w (a0,d0.l),d0

High word of d0 may contain 0 or 1 in the low bit, all other bits 0.
Before: d0 = xxxxxxxx xxxxxxxx hhhhhhhh llllllll
After: d0 = 00000000 0000000? llllllll hhhhhhhh

I don't know which one's the faster.

/Kristofer.

> |____________________________________|_____________________________________|

Thanks for the info, but I am taking the easy option: The STe has a
built-in light-pen input which latches two hardware registers with counter
values derived (I assume) from the memory address currently being shifted
out to the video port. Thus the latency from when the light-pen is
activated to the read from the registers should not affect the value.
Since the read is performed completely asynchronously from the screen
timing and the values (which are continuously read and displayed) only
change when the light pen is activated, I assume that the registers are in
fact latched versions of counters at the activation time.

If I were using interrupts to grab the X and Y positions, I would not
expect to get too much accuracy with the X position, since as you point
out the interrupt service latency is going to vary with priority, system
load and DMA activity. But the point of the STe's latches is that this is
bypassed by hardware. So what's wrong...?

I'm not recently familiar with the 68K instruction set, but using 3 XOR operations one can perform an *in place* swap.

```
SWAP(A,B)
A := A XOR B;
B := B XOR A;
A := A XOR B;
```

I hope this helps...

David

4566. ST to VGA pinouts - Here they are!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-30 16:47:27 UTC
From: e2daka5@etek.chalmers.se
Message-ID: <1994Aug30.164727.24638@etek.chalmers.se>
Source record: 30596

OK, here are the pinouts required for connecting a VGA screen to your ST:
(Works ONLY in hi-res.)

ST monitor out VGA screen

```
4 3 2 1 1 2 3 4 5
x x x x x x x x x
8 7 6 5 6 7 8 9 10
x x x x x x x x x
12 11 10 9 11 12 13 14 15
x x x x x x x x x
13
x
```

Atari monitor 15 pin D-sub
connector connector
(might be hard
to find...)

Look for the numbers on the connectors to get it right.

The connections are:

* ST pin 4 (Monochrome detect) via a switch to ST pin 13 (Gnd)
Makes it possible to have the monitor connected all the time, just flick
the switch when you want to use the TV set for mid and low res.

* ST pin 11 (Monochrome) via a 67 ohm resistor to VGA 1,2,3 (R,G,B, I think...)
Since the VGA screen is color only, the monochrome signal has to be fed
to red, blue and green to make the picture black and white...

* ST pin 12 (VSYNC) to VGA pin 14 (VSYNC)

* ST pin 9 (HSYNC) to VGA pin 13 (HSYNC)

* ST pin 13 (Gnd) to VGA pins 6,7,8 and 10

Disclaimer:

I don't know if this will work for you, but it surely did for me...

Don't forget:

If the picture is flickery and/or very small, you'll have to open your monitor
to locate some trim potentiometers to adjust the VSYNC rate and/or the size
of the picture. Since the VGA monitor is set for a VSYNC rate of 70 Hz, and
the ST's VSYNC rate is 71,25 Hz (in mono), the picture will never be as good

and stable as on an SM 124/SM 144.

Also, remember to be V-E-R-Y careful when you have opened the monitor,
since there are HIGH voltages present :-/ Use an insulated screwdriver.

Hope this helps!!

I came across this a number of years ago while looking through ST
Internals. It appears to be for TSR programs and they don't need to be
reloaded each time you reboot, they remain resident over a warm boot.

>Does anyone know what this facility is for and the correct way to use it?
No idea. I do remember that the only way for the code not to be
overwritten was to call Getmpb as soon as they were called by the OS.

Using Screenblaster in true colour mode (I do 800*600 virtual) you'll have
a slower screen build-up indeed, but programs that make use of the true-colour
mode seem to benefit: instant 24 bit image display (StudioPhoto, Charly
Image) and fast processing. It could go faster of course, but 16 mhz is
fine by me.

There was a very similar situation with the old BBC micro (which had
built in lightpen support via its analogue joystick port too) - the
problem is not how long it takes YOU to read the current value from
the hardware registers (this error should be just a few pixels anyway
thinking about the pixel rate relative to CPU clock speed), the real
problem is how long it takes, once a pixel has been generated by the
shifter, for the data to propagate through the monitor hardware, the
electron beam, the phosphor to light up, the phototransistor in the
lightpen to respond, and the amplifier circuitry in the lightpen to
notice. I think phototransistors tend to be fairly slow anyway.

The only fix is to write a calibration routine that asks the user to
point at a fixed point in the middle of the screen, read the registers
and use the difference between where they say the user clicked, and
where you know they should have as a sort of fudge value.

Or buy a pen-mouse and find an appropriate acceleration factor for your
monitor.

Good luck.

John

Howdy,

Try Atari ST Internals (By Data Becker) or The Atari Compendium,
both books have the tables along with descriptions...or if you can't
find either of those...I suppose I could type the tables in and e-mail
them...

Cheers,

-Magic

I have two technical problems with my Falcon. I hope somebody can point out what's wrong.

1: The colour problem

Two of the colours in 256-colour mode behave very strange. At dark colour values, they act normal, but when one of the RGB-scales get over a certain point, the result is that the colour suddenly goes quite dark again.

To illustrate: When I want to make the colour lighter, by incrementing one of the RGB-scales, the colour intensity normally should go like this:

```
.
. .
. but instead I get this: . .
. . .
. . .
. .
```

2: The sound problem

I managed to destroy the left sound channel, but I can't get it to work. I have tried to change the tiny amplifier chip without results, and I have searched `the whole' motherboard for errors. What can be wrong?

>Cubase under Windows on a PC is fraught with problems but it runs just
>great on an ST so I keep my ST and use it ONLY for Cubase.

It may be worth adding here that the Cubase users mailing list is frequented by two types of person. One type owns an ST or a Mac and talks about Cubase tricks. The other sort owns a PC and talks about DLLs, IRQs, MPU401s and crashes. Lots of crashes. In my not-so-humble opinion, if you want to run Cubase (UKP350ish), you presumably have a fair selection of MIDI hardware. And let's face it - you aren't going to get much in the hardware line for UKP250ish (which I paid for my 2MB STe when my old STfm got stolen) Treat the ST as a part of your music set-up which also happens to do lots of other good stuff easily and cheaply. It won't blow the world away for speed, but it does the job well enough. In passing, I'm just finishing writing my thesis and after massive pain using Ami on a 386/33 w/4MB of RAM, went back to Redacteur, Calamus and Kandinsky. And it's crashed about 4 times in 4 weeks, which, as far as I'm concerned is bloody good going. Remember, system stability counts for just as much as out-and-out speed, and stability is one thing that the x86/DOS/Windoze combination does *not* have.

Just my 2p worth, of course. Anguished PC owners can reply by mail.

Cheers

While doing a port of X-fractint, I found I could gain a few cycles if I use some bitfield instructions. The trouble is that I am doing this in gcc/gas and don't know how gas expects the syntax of these instructions.

So, in short, how do I express:

bfins d2,d6{0:29}

in MIT/gas syntax ?

Anyone know where I could find a reference on gas/mit syntax ?

And ouch.
While rewriting some of the x86 assembly, I rediscovered why I hate that architecture so much...

But I have built a pen for the BBC and it didn't have much of a problem:
at pixel rates around 6MHz the speed of a phototransistor & monitor delay are
not going to make an appreciable difference, plus the 6845 CRTC held the
light pen register and presumably was designed to work with a minimal delay
error.

This is a fixed propagation delay, which would manifest itself as a
permanent linear shift to the left of the pen position. What I get are
almost _completely_ random X values, but a 100% accurate Y value.
I am basing my "accuracy" on whether the value is steady or not: the Y
values are displaced by a fixed amount, which is easily nulled out by
software, but if no two X values seem related in any way, there is little
hope of providing a horizontal position reading...

4583. help on cross g++ needed!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-08-31 14:17:58 UTC
From: bfaust@saratoga.physik.Uni-Osnabrueck.DE
Message-ID: <3423em$16n@deimos.rz.Uni-Osnabrueck.DE>
Source record: 30615

Hello!

I compiled a cross gcc on a HP9000/710 using the gcc 2.5.8 sources from
prep.ai.mit.edu and the updates 36-40 from a.a.u.e.
The C part works fine, I cross-compiled several programs including
MiNT 1.11, these programs work fine on my old ST.

But when I tried to cross-compile some C++ programs I came into trouble.
When I try to compile the simple program hallo.cc :

```
#include <iostream.h>

int main(void)
{
cout << "Hallo Welt!\n";
}
```

using: cgcc -v -o hallo.ttp hallo.cc -lg++

I get some strange error messages (from the linker I think):

```

Does this light pen work on another system?

You could be obtaining the eroneous results due to either misadjusted monitor
or an insensitive light pen. Try the following:

On a black screen put up a single vertical white line, centered
horizontally that goes from the top of the screen to the middle.

Read the light pen position and draw a small vertical line at the
bottom of the display. Vary the levels of the contrast and brightness
and see if the horizontal tracking improves.

Have the program use a key to cycle the color of the line through
the monitors primary colours (red, green, and blue). Repeat your
adjustments of the monitor until you are satisfied.

One problem with light pens is that the different phosphours in your picture
tube give off different amounts of light energy, with green giving off the
most and blue giving off the least. Which means that you may not be able to
accurately detect blue without a large increase in intensity and/or contrast
while you can accurately detect green and red.

If you are unable to adjust the monitor to obtain the desired results
then the culprit may be your lightpen. Open it and ensure the detector
is perpendicular to the barrel of the light pen.

Good luck,
Brian

Is there anyone out there that have some ASCII docs on Falcon 030
hardware registers and the dsp 56001. I have done some 68k programming
on the STE, and have done some grouadshading vectors on Falcon using
the 030. I did it without any docs, so i vould love to get my hands on
anything.
Doing vectors with the 030 is boring since i keep thinking of the
possibilities with the dsp. If anyone has a dsp 56001 or falcon 030
-book, and an ASCII scanner and a bit of initiative, life would
be so much brighter for us Falcon coders.

4587. DEANSI.ARC???

From: lunman@ChamplainCollege.QC.CA
Message-ID: <3438gs$kd5@samuel.ChamplainCollege.QC.CA>
Source record: 30550

Hello all! I've been programming in Heat & Serve (Sozobon) C on my lil' ole Atari ST for quit some time now. But I'm also doing a lot of TURBO C on the PC. I generally make my code portable but on the PC, I write following the ANSI standards (prototypes, etc...).

The problem is that HSC does not conform with ANSI C and I can't compile my code without long and tedious 'DE-ANSIing' it.

A long time ago, I found a program called DEANSI.TTP in a file called DEANSI.ARC, somewhere on the net. I downloaded it, and saw that it did the ANSI C to OLD C conversion. But at the time I needed no such program.

Now I do. And I can't find it ANYWHERE!!!! 8-}

If anyone out there has this file or knows where I can find it, PLEASE let me know.

Jon Lunman

>
> Or _is_ there, by any chance, software using the extended joysticks?
> Nah, probably not...

I have heard rave reviews of the Gravis Mousestick, which is designed to replace the mouse as a controller for games. It is supposed to be great for flight sims, which really benefit from a velocity-sensitive controller. On the down side, they are a bit pricey. Anyway, this is a compatible way of getting an analog joystick to work with existing games and such.

Now, what would be interesting is if one could come up with a way of turning a stock PC analog joystick into a cheap "Mousestick workalike"... I'm not sure exactly what the data looks like coming from such a joystick, or a mouse for that matter, but it might be fairly easy to do. Anyway, food for thought....

Check out hardware.lzh in /Programming on atari.archive.umich.edu. It is
billed as "ST/STe/MSTe/TT/F030 Hardware Register List". Check the topmost
0index file for DSP information (I think there is some in there somewhere).
Hope that helps.

Different problem. This can be done by the 'exg' instruction on the 68k.
Problem to solve is to swap low byte and high byte in a 16 bit word.
Rotate is too slow. High byte can't be written to memory without the low
one. CPU is big-endian. Unaligned word access on some CPUs results
address error.

By the way, on 68020+ would that solve the problem ?
(I have no timing info off hand, so maybe it's slower than checking it
bit by bit ...)

```
unpk d0,d0,#0 ; low byte->low word, high byte->high word
swap d0 ; swap words
pack d0,d0,#0 ; pack words back to bytes
```

You've discovered a feature that has been there since TOS 1.00. I have
documented this for the first time in an article on TOS 1.02 when it
was released in 1987. This is a feature that is inherited from CP/M 68K.
It is useful, as you already found out, for programs which need to
be started in the reset phase before the memory has been initialized,
such as reset-resident RAM disks. Other than that, it has also been
used for implementing a virus as you have discovered.

To my knowledge, the feature has never been documented officially,
so that's probably why you didn't know about it. I think it is also
mentioned in several books such as the Profibuch.

4592. Read from parallel port (520 ST)?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-01 05:52:57 UTC
From: giddings@sadie.chem.wisc.edu
Message-ID: <343q7p$de6@news.doit.wisc.edu>
Source record: 30623

Still fighting with 520ST BASIC - I should just try to find a C compiler somewhere. But, in the meantime, I have the following question:

I am trying to read a byte from the parallel port using the BASIC INP(0) command. The system hangs on this, no matter whether there is data to be read or not. If I do an INP(-0), which supposedly gives port status, the system hangs as well (negative zero seems pretty strange anyway. . .).

Does anybody have advice how to read from the parallel port? Can it even be done? Should I use a GEM call?

Thanks for any information,
Michael Giddings
giddings@whitewater.chem.wisc.edu

TOS does not support reading from the parallel port. There is no BIOS, XBIOS, GEMDOS or GEM function to do that. You will have to turn the ports direction by programming the psg youself. You might do this by using Giaccess() in BASIC or any other language. Be shure not to attach a signal to the port until you altered its direction, because normally the psg drives the data lines and it's possible to cause damage to the psg by driving the lines while they're programmed as outputs.

Hope that helps,
Till

|> Jacek.

They're not big or little Indians, they are big or little endians.
A big endian is a machine, that stores words with leading most significant byte
(680X0, sparc, power-pc). A little endian stores the least significant byte on
the lower address (80x86, power-pc). A power pc can switch between both modes
to make it easier to emulate both, 680X0 and 80X86.
For example: The word $1234 would be stored
12 34 by the 68000
and 34 12 by the 8086

It looks like the g++ library was compiled with an older g++ version.
There were some bugs in the name mangling in many versions, which were
fixed in 2.5.8 (i think). Unfortunately the changes are not backward
compatible, but you are always supposed to use the g++ library
compiled with the same g++ version. Try to recompile the library.

Having just got the internal host adaptor for my MSTE, and the 1 gig drive is in the post, I was browsing through a config file on the utilities disk. One section had a limit for the number of sector per partition of 32K and, in the comments line, said not to alter this number. Is it dangerous to alter it, as even with big sectors I would need more partitions than are available.

BTW the drive is part of a _big_ upgrade. HD and streamer, 4 megs, 2 HD floppies, all recased. Advice given and accepted on all things relevent to this.

Thanx

the hatter

This is wrong: you can use the BIOS input routines to read from the parallel
port.

Probably, as that is likely to be a maximum value attainable in a OS defined
standard datatype. Increasing it would make accessing the additional sectors
a bit problematic, I think.

> BTW the drive is part of a _big_ upgrade. HD and streamer, 4 megs, 2 HD
> floppies, all recased. Advice given and accepted on all things relevent to
> this.

I guess this is AHDI you are talking about. My understanding is that one
can have partitions C-P at a max of 256mb each, using ICD software (you would
want to get the Pro level, unless you use an ICD host adaptor in an external
device), with the logical sector size max'ed out (at 4096 bytes each, I think).
This would yield 3.584gb max mounted space (you could have more and swap the
partitions around using the ICD desktop.prg). Of course, you would also
waste quite a bit of space doing it this way, as the smallest allocatable
unit would be, uh, whatever a cluster is (two sectors? So 8k?). However,
with 1gb you will have space to burn :-).

With all that said, I thought the latest AHDI had the same limitations as
the ICD software, so maybe I'm confused. Hope that helps.

Hi people

Got a question...well, a couple...

Someone is having a few problems...and I do not know the answer...so I'll see if your expertise can help my friend..

Got a Citizen Swift printer connected to the Mega STe. Now, when trying to print out from Deluxe paint, Touch up or even ImageCopy 2, it just prints out lines.

Know what this person is doing wrong?

Also, anyone know why a scanner will not work on a Mega STe, ion both 8 and 16Mhz modes? It worked perfectly on a normal STe. Are the cartridge ports different?

Yours in anticipation.

I can only only think of two things:
1) The printer's dip switches are set for emulation that isn't being supported by those programs (e.g. printer is set for IBM emulation and the programs are using Epson); or
2) The printer drivers were never set up for that printer.

Best of luck,
Tom

Hmm, if you are about to use large partitions, I strongly advice you to use
mint and minixfs instead. Minixfs ver.2 always uses 1024 byte sectors -
independently of partition size. This gave me some additional 40 Mb when I
converted one of my big FAT partitions into a minix filesystem.
(With a clustersize of 8k, the average loss will be 4k per file versus 512
byte on the minix filesystem.).

(Section of very technical stuff follows here)

Minixfs ver.2 partitions use 32 bit block pointers, which means it should
be able to handle 2^31 * 1024 byte partitions. (One bit is lost to the
sign). However, the low-level harddisk software on the ST (the scsi-stuff)
only knows how to deal with 512 byte blocks, which reduces the maximum
possible disk-size to 2^32 * 512 bytes (2048 Gb) anyway. This is for the

machines with real scsi (TT-falcon). On ACSI machines, only 21 bits are available for the block number, which means a maximum of 2^21 * 512 bytes (1 Gb) per disk. However, some Host-Adapters knows how to send extended SCSI commands (some ICD ones at least), so that 2048 Gb partitions is theoretically possible even on a 1985 ST :)

I am not sure whether the ICD software or AHDI is able to use the extended scsi READ/WRITE commands however, so you might be stuck with 1 Gb partitions anyway. But if the software is able to format/partition a disk > 1Gb, I would be surpriced if it did not support the extended READ/WRITE commands as well.

Another trouble you might stumble into, is that HDX only allows you to partition your disk to partition sizes that the FAT filesystem knows how to handle. I edited my partition table by hand...

4608. Help with link errors in GCC

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-01 18:16:46 UTC
From: hopper_t@msupa.pa.msu.edu
Message-ID: <3455qe$lh3@msuinfo.cl.msu.edu>
Source record: 30635

Hello,

I've got GNU C (2.5.8?) up and running on my MSTE4, and I've written a few very basic TOS programs which compile and link without problems. I decided to try programming a very simple GEM program (execute, get a valid handle, and then close down properly), but I get link errors when I do.

The error is:
m:/cc1000001.o undefined symbol _appl_init referenced from text
and the same errors for _graf_handle, _v_opnvwk, _v_clsvwk, and _appl_exit.

If anyone can offer any advice, I'd greatly appreciate it. The program is attached below.

Thanks,
Tom
hopper_t@msupa.pa.msu.edu

```
#include <aesbind.h>
#include <vdibind.h>
#include <osbind.h>
int contrl[12], intin[128], intout[128], ptsin[128], ptsout[128];
int work_in[12], work_out[12], handle, pl[16][3];

main()
{
/* int contrl[12], intin[128], intout[128], ptsin[128], ptsout[128]; */
/* int work_in[12], work_out[12], handle, pl[16][3]; */

int i, nul;
appl_init();

for(i = 0; i < 10; work_in[i++] = 1);
work_in[10]=2;
handle = graf_handle(&nul, &nul, &nul, &nul);
v_opnvwk(work_in, &handle, work_out);
v_clsvwk(handle);

appl_exit();

}
```

You'll notice I have the same declarations, one commented out. This was because I decided to try it in both places to see if it made a difference (some code I looked at declared variables in both places). It made no difference.

Thanks.

My videocamera has a video "in", and I was wondering if it would be possible somehow to record the video signal from the STE on tape, so I could make my own "credits" and other titles etc. on the computer and just record this, and edit the tape later.

Does anyone have a circuit for anything like this? I can use either the "S-video" or normal "video in" input, since this is a Hi-8 camera.

many thanks.

4613. Help with Lattice C and ASM linking

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-01 23:40:34 UTC
From: R.M.Morris@massey.ac.nz
Message-ID: <R.M.Morris.17.2E666672@massey.ac.nz>
Source record: 30639

Hi!

I am trying to combine some machine code with my C source (Lattice 5.06.02) and am having lots of trouble doing it.

I followed the brief instructions in the manual to use inline etc. but to no avail.

I can get the routines from the manual to work though, but I need to include my code - it doesn't call any OS routines or anything.

Help me please?????

I don't want to be stuck having to use GFA Basic to include my m/code routines.

Any help would be really appreciated,
thanx,

Richard r.m.morris@massey.ac.nz

PS. My routine is to print proportionally spaced fonts on the screen a LOT faster than GDOS - although no clipping ... (yet)

Works fine from Assembler or GFA 3.5 though.

4614. IDE hard drives on Atari ST

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-02 00:10:52 UTC
From: shendrix@escape.widomaker.com
Message-ID: <1994Sep2.001052.184@escape.widomaker.com>
Source record: 30547

I need to make use of an IDE hard drive. It would be good if I could use it on an ST since the old 20 meg Atari drive is small, slow, and probably not long for this world.

I figure there must be a converter or interface for Atari ST's to use IDE drives, they are just so cheap now. I've been told on another group that on the Falcon can use IDE. Any information would be appreciated.

4615. MiNT problem (?) - segmentation fault when copying files

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-02 00:35:04 UTC
From: robotron@moroder.demon.co.uk
Message-ID: <199409020026.AA00758@moroder.demon.co.uk>
Source record: 30543

Using MiNT 1.10h8 with Minixfs 0.60, I get segmentation faults when I try to copy files around on my D: drive. (D: is a 120MB TOS partition.) For example, I can do (where /etc is a link to /e/etc, E: being a MinixFS partition):

```
cp /etc/passwd /a/test
cp /etc/passwd /c/test
cp /etc/passwd /d/test
```

The last copy will produce an address error, a bus error or a memory fault, depending on whether I was copying or moving a file and other unknown factors, although the file appears to be copied okay. (The fact that copies to drives A: and C: work fine would seem to suggest the partition size is somehow too large.) I've used two different versions of "cp", with the same result. Also, "echo hello > /d/test" seems to work every time.

I can't be sure where the problem is - it could either be my hard drive software (SDManage), MiNT or Minixfs, as far as I can see. Has anybody else encountered this problem?

Stephen

>by programming the psg youself.

Really? When I got my ST, I wanted to transfer all my old ZX Spectrum
text files (yup, a long time ago :) to it. I had a disk interface on
the speccy with a parallel port, so I just rustled up a cable to connect
the ST's parallel port to the speccy. I used the BIOS calls on the ST
to *read* from the parallel port at the same time as 'printing' text files
on the speccy. It worked; I have the files on the ST to prove it! :-)

Admitedly the BIOS does not handle reading from the parallel port very
well, but it _can_ be done. Just don't ask me for examples, the bit of
code I wrote way back then has long since departed for the bit-bucket.

Cheers, Steve

You need to add -lgem *at the end* of the gcc command line (after the
object files anyway).

4622. VDI colors: HELP!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-02 16:37:16 UTC
From: millert@grad.csee.usf.edu
Message-ID: <347kbs$c8k@mother.usf.edu>
Source record: 30553

I'm trying to figure out exactly how VDI maps its color values (0-1000)
to the hardware values.

Say you're using an ST. Then the VDI would have to map its colors
(0-1000) to the hardware (0-7). What formula is used?

Well, I have two possibilities and I need to find out which is the
correct one.

If I want to convert 0-1000 to 0-7 in a manner which gives equal weights
to all values, then I would use the following formula (using integer math):

h = v * 8 / 1001 [v is VDI number; h is hardware number]

Adding one to the max value gives equal spacings for each of the mappings
from 0-7 to 0-1000. The following is a table of values which map
correctly according to the above formula when the result of the division
is truncated and not rounded in any way:

HARDWARE VDI
0 0-125
1 126-250
2 251-375
3 376-500
4 501-625
5 626-750
6 751-875
7 876-1000

However, if the mapping is not done properly and the following formula is
used:

h = v * 7 / 1000

then equally sized ranges in the VDI numbers won't be assigned to the
hardware values and that will result in the following mapping, where the
remainder of the division is thrown away as above:

HARDWARE VDI
0 0-142
1 143-285
2 286-428
3 429-571
4 572-714
5 715-857
6 858-999
7 1000

As you can see, only one value maps to the highest value, and all the other ranges are disproportionately large.

Regretably, after seeing the logic and programming techniques used by many programmers, it does not seem all that unlikely that the second, improper, mapping would be used by the VDI.

SO, what I want to know is how does the VDI actually do that mapping, so that I may cope as necessary?

I had the same problem. I had to send my Falcon back to Atari because my
left channel went out, and finally got it back after God knows how long.

I think there may be a design flaw. Good thing for me it went out just
before the warranty expired.

It looks to me like Atari took a new Falcon and just moved my hard drive
into it. The case, at least, is obviously brand new (I can tell).

You know that timing problem in the falcon that causes problems with
Cubase, etc? I asked them to fix that. Is there any way I can tell if
they actually did fix it?

I also asked them to bypass the bass boost. How can I tell if they did that?

Shoot, I'm going to have to check my TOS version to make sure they didn't
give me an older model.

Happy computing!

o> didn't need it then and I can't find it in Imperial College now.

The best and perhaps the easiest is to put the new addresses of
the font data in the Line A variables. You will then be able to
use the normal GEMDOS/BIOS routines to display the text.

However you can't naturally use GDOS fonts here and I suspect
that FontKit is the only program which can edit these fonts.

If you want assembly routines to change the fonts then mail me ,and
I'll mail you back the routines with an example font.

>Does anybody have advice how to read from the parallel port?

The parallel port can be read from the XBIOS function, Bconin.
The assembler routine is:

move.w #0,-(sp) device = Centronics port
move.w #2,-(sp) bconin
trap #13 call xbios
addq.l #4,sp align stack

The input is returned in the low byte of d0.

4633. Upgrading 520ST memory

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-03 05:19:42 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <34911e$t5m@mailer.fsu.edu>
Source record: 30566
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a 520STFM that I would like to upgrade to at least 1mb. It has a rev. D motherboard. There is one row of 16 chips on the bottom edge of the board, with another 16 places for chips above them. These have solder filling the holes, but appear to have traces and such going to them.

I found some instructions on a.a.u.e that tell how to upgrade such a machine to 2.5mb using 2 1mb SIPPs and some serious (to me, at least) work. I would be willing to live with just 1mb if it were easier.

So, can I just fill those empty 16 places with chips?

Is it feasible to suck the solder out of those holes and put chips in there? I'm not an experienced solder person, but I'm willing to try if it is a task that one might hope to be successful at :-).

Are there any other steps, or will the machine recognize the additional 512k automagically if I do this?

What is the "piggyback" memory upgrade that I have heard mentioned previously? This seemed to be a popular way to upgrade these machines, but I'm not sure if it is only for going from 1mb to 2mb, or some other combination that won't help me :-).

Any and all help will be greatly appreciated. Thanks in advance.

4634. internal DSDD drive question

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-03 05:37:39 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <349233$t5m@mailer.fsu.edu>
Source record: 30567
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a 520STFM with a single sided internal floppy (SSDD) drive that I would like to replace with a double sided drive (DSDD). It is the type with the long thin parallelogram-shaped eject button centered underneath the disk hole.

If I were to get an Atari SF314 DSDD external drive (with the same button configuration), could I just pop it out of the external case, stick it into the computer, and have it work as drive A?

Are there any other steps to making the computer recognize such a drive as drive A?

Is there anything that needs to be done for the machine to recognize that a DSDD mechanism has been installed?

Failing this, how hard is it to make the computer think an external drive is drive A? Could I do it with a fancy cable, or do I have to hack on the guts of the machine?

Finally, does anyone happen to have an internal DSDD Atari mechanism lying around? Perhaps a dead 520 or 1040 whose drive still works? I will pay a reasonable price plus shipping. Please email if (by some miracle) you have one available. Thanks in advance for any help.

> it, as even with big sectors I would need more partitions than are available.

The maximum number of physical sectors per partition is limited to
2147483647. There is no limit to the number of partitions per disk.

The maximum number of logical sectors per TOS filesystem depends on TOS
version, 32766 for TOS < 1.04, 65532 for TOS >= 1.04. The maximum number
of data clusters per TOS filesystem is always limited to 32766. The
maximum number of filesystems (on all harddisks) handled by Gemdos is 14.

On a 1GB harddisk you could install 8 partitions of 128MB, each containing
a TOS filesystem with ~32766 data custers (clustersize = sectorsize = 4096
bytes).

Obviously, they needed to change the whole motherboard. I have a little problem, as I live in
Norway, but ordered my Falcon from Germany. I don't want to send my computer all the way across
Europe. Does anyone know what a Falcon motherboard costs?

4640. Atari Falcon and Quantum EMPIRE 1080S!?!??

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-03 20:06:13 UTC
From: pvaihine@aton.abo.fi
Message-ID: <PVAIHINE.94Sep3220613@aton.abo.fi>
Source record: 30572

I didn't find any group for Falcon so I try here.

I have a friend that has an Atari Falcon and he bought Quantum Empire1080
SCSI-3 Hard disk. The problem is that the controller doesn't find it.

He is trying to connect it via the external cable that has an adapter
that converts it to flat ribbon cable with the 50-pin layout.
An Quantum LPS240S is working on this configuration!

Is there any special things in Falcons SCSI-controller?!

Is it possible to get this drive to work with this computer?

The Empire is 1 Gigabyte hard disk.

I would prefer email because I don't read this newsgroup on regular basis.
However, if I get answers I will post a summary.

Can some explain how to work out clock cycles?

I know each assembler instruction takes a certain amount of clock cylces, add them up and the lower used the faster your code..

It was semi explained to us in college how to work out the time taken for it to execute the instructions but it wasn't explained very well.

You can work it out in micro/milli seconds according to the clock speed or something??

>520, 1040 and Mega ST's??? If you have a source, have an old ST busted or wh

It was a very standard part ISTR. Atari tended to use the Yamaha made ones,
but the GI AY-3-8190-2 (or something like that) is identical AFAICR. There
are at least 3 versions. The one you need is the 40pin DIL version with
the two 8 bit ports (as these are used for the printer and floppy select
lines).

BTW the Yamaha part number is YM-2149 apparently.

Hope that helps,

:-)

Roland.

No

>Is there anything that needs to be done for the machine to recognize that a

No

>Failing this, how hard is it to make the computer think an external drive
>is drive A? Could I do it with a fancy cable, or do I have to hack on the
>guts of the machine?

In the UK 'drive B' cable switchers were available a few years ago which
did just this. Alternatively a small assember routine will work in most
case.

Roland

@CiX

Disclaimer: I have't actually tried any of the above myself, although I
have played with mixing and matching SS and DD external drives on an STM
(which doesn't *have* and internal drive ;-).

4644. GCC and long filenames

Newsgroup: comp.sys.atari.st.tech

From: dk3uz@isys-hh.Hanse.DE
Message-ID: <DN8RBKVM@isys-hh.Hanse.DE>
Source record: 30577

Putting together a MiNTlib (pl43) using GCC2.5.8 with options -m68020
& -m68881 under MiNT with minixfs 0.6PL9, minit_ed to -n2, I ran into
the following problem on my TT:

With module _udivmod.o already present, GCC will compile _udivmoddi4.o
also into _udivmod.o, although everything looks ok on the command line
passed from compiler driver to preprocessor etc.

Btw, UNIXMODE is 'cu/rUx', and MiNT is version 1.09.

Am I buggy, or is a piece of software?

Rgds, Eddi

IS>I lost my F: partition twice before I figured out what was going on. You
IS>are 100% correct about the problem: when one partition fills the
IS>following partition's boot sector is overwritten.
IS>You need AHDI 6.05c I believe. I found it on GEnie. I also think you have
IS>to reformat the hard drive to install the new driver. My local Atari
IS>dealer did it for me without losing any data. (They stored it on a 88MB
IS>Syquest temporarily.)

There is a newer version of the AHDI driver in the archives. You don't
have to reformat the hard disk. Just copy the AHDI.PRG into the C:
driver pressing ALT while doing it. When the dialog appears enter the
name SHDRIVER.SYS and press the OK button and the one that follows.
You can then boot with the new driver in place.

If you like faster responce from your hard disk get XHDI. It is faster
and more reliable plus you don't have to reformat the disk to install
it.

Michael Papadopoulos.

> unknown factors, although the file appears to be copied okay. [...]

Some versions of `cp' and `mv' (when copying files) use their stack to
copy the file into memory. As the stack is always of fixed size in
MiNT, this can lead to the program overwriting its own (an other
program's) data, causing interesting crashes. Depending on whoch
version of `cp'/`mv' you're using, you may be suffering from this
problem.

Some of those single sided drives have funny connectors, and some times the
cable that is fitted in the ST can be a bit short, you might have to twist
the cable, as their are no standards on witch way the plug goes...

There are no other problems when fitting a DSDD drive.....

Just for clarification: XHDI is not a driver, it's a driver specification.
The docs are available in German and English, e. g. on ftp.uni-muenster.de
At the present there are two drivers supporting XHDI: HuSHI and HDDRIVER.
XHDI (eXtended HardDisk Interface) provides a lot of useful functions
related to hard disks.

4650. Help with 1040STe/TOS 1.6 problem.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-04 18:09:36 UTC
From: mack@netcom.com
Message-ID: <mackCvMAG1.3wx@netcom.com>
Source record: 30583

I have an Atari 1040STe with TOS 1.6 which just had a HD crash. I can deal with that, BUT I can't figure out what the "patch" was that allowed the machine to boot up in MED rather than always LOW res.

I've looked through and tried all the TOS Fixes on the Mich. Archive, but none seem to help at all... I thought Atari issued a patch right after 1.6 came out, but can't find it.

Symptoms:

Always boots in LOW res even though desktop is save in MED res.

2nd problem...

Even though I have white set to 777 in the Control Panel, on reboot, the "brightness" drops to 666 and the screen dims a notch. I this the infamous "666 virus"? :-) Seriously, any clues to making this stable?

Thank YOU for helping me through this HD crash.

Larry

OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file

- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decomompression program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

Just some info on the CWAC file that I aranged to put onto A.A.
in the Archivers directory...

CWAC = Cool Wave Archive Converter.. (ENGLISH)..!!!

It will let you convert for one group of Archive formats to one other,
no need to run it each time for different formats, you give it a list of
formats and away it goes, totaly GEM based program....

Very handy for BBS users and people with lots of different Archive files
on the hard drive...

You will need also these TTP's for the Archive standards,
ARC602/AJR/ZIP26/LZH201L and ZOO2.1..

Big NOTE: only use the USA version of ZOO 2.2, and only LZH201L..

The Author of LZH3101 and the other lower versions, have stuffed up the way
Thomas Questers LZH201L option for setting BasePage, its a pity as you can't
use LZH3101 with CWAC, but can be used for extraction..

I wrote to the Author of LZH3101, about making it compatible with
Thomas Questers LZH201L, but he refuses to change it, this is a shame as its
transperent to the operation of LZH3101 and does not do any harm..

I would suspect that the linker you are using is not linked with the
mintlibraries, and therefore doesn't know what to do with the long
filename.
Try getting a new gcc-ld from the Mint directory at atari.archive. Probably
under a directory named binutils or something...

Hello,

If you have a Falcon, TT, or 68020/68030/68040 enhanced system, and
are willing to beta-test the latest version of MasterBrowse in exchange
for a registered version, please contact me. I have received a report
of problems with the Falcon, so I want to a) find out if there is in
fact a problem and b) fix it as soon as possible.

If you are interested, please contact me at:

mforget@worldgate.edmonton.ab.ca

Please DO NOT reply to this message, since I only read news/mail from
this address once a day whereas I check my mail at the above address
several times a day.

|> than on the 68000, let me know as well.

Bit late on this topic.....

I seem to recall using the 'movep' instructions many years ago to perform byte swapping on a largish buffer of data. Went something like:

```
loop:
movep.l (0,a0),d0
movep.l (1,a0),d1
movep.l d0,(1,a0)
movep.l d1,(0,a1)
add #8,a0
dbra d2,loop
```

Six instructions per eight bytes swapped.

>(Sorry, these are probably FAQs, but I could find no place with answer.)

According to:

Samuel P. Harbison, Guy L. Steele Jr.
C A Reference Manual
Third Edition
Prentice Hall

The DEC PDP-11 is an example of a computer that falls in between
two models. Although basically a 16-bit little endian, when
referencing 32-bit integers the two 16-bit words are organized in
big endian fashion:

Middle EndiAn 01 02 03 04
(PDP-11) A+1 A A+3 A+2

There is ansi2knr which is distributed with some GNU programs (e.g., GhostScript).

|> If I set this flag, does the program automatically reuse the same code in
|> memory for all the times it's loaded?

Yes.

|> How does MiNT know that it's the same program? How is this handled?

It keeps the program file open and checks at the next invocation if
it's the same. This is independent of file names.

|> What exactly happens here?

The compiler changes all references to alterable data into a base
relative addressing mode. The startup code is responsible for setting
up the base register to point to the real location of the data (this
is the difference between crt0.o and bcrt0.o). There is also some
special support in the linker to resolve the external references, and
it sets a flag in the program header to tell MiNT that it's sharable
text. When MiNT loads such a program it separates the text segment
from the data and bss segments and marks it as beeing sharable. Note
that there is currently no support for protecting the program from
accidentally writing into the text segment, even if you have a MMU,
but that's not much of a problem in practice.

|>
|> You can work it out in micro/milli seconds according to the clock speed or
|> something??
|>
|> -Paul-

Well, for the newer processors which use pipelining and such things, it's no longer possible, but for the older real serial processors (like the 68000) for example there are tables giving you the number of clock cycles every instruction takes to execute. As you said, you just add those numbers of cycles for all the instruction of your program (or subroutine) up and to calculate the time it needs to execute you just have to devide the sum of cycles by the clock frequency of your computer. I. e. for a standard ST with 8 MHz (Mega Herz = 10^6 Herz = 1000000 Herz) you have to devide by 8*10^6 = 8000000 to get the execution time in seconds.

4664. Basepage offsets..??

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-05 13:32:39 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <34f6ln$3t4@golem.wcc.govt.nz>
Source record: 30647

I am trying to get to grips with ARGV, I have the Doc's that was posted here some time back, but a lot of it is not much help if you use Devpac asm..!!

Some of the books that I have give conflicting statments for some of these basepage offsets...

1. 32 $20, Pointer to DTA and also Symbol table..???

2. 36 $24 Pointer to parent's basepage..??

3. 44 $2C Pointer to environment and also parent's basepage, if the env is not used in the Pexec call..??

Some books that I have never refer to 36 $24 at all..

Another one quotes 32 $20 as the Symbol table pointer and stated that 44 $2C, will point to the parent's basepage if 'env' is a 0, in the Pexec call..??

Does this depend on the TOS version or is it some of these books are out of date, or just a load of rubish...??

Thanks....

Does Devpac 3 have better support for ARGV, ie, Libraries or Macro's as 2.25 does not...

I have a set of backup disks I made several years ago (using Turtle)
just prior to selling my STe. I ftp'ed MTool off the net, but it only
reads standard MS-DOS disks. Has someone hacked MTool, or has some
other piece of software that can be used to access TOS floppy disks
from a UNIX workstation?

Christopher

P.S. The specific workstation is a NeXTstation, however any sofware
which compiles on a BSD based UNIX should be OK.

$70 is the VBL vector, or Vertical Blank Interrupt (VBI).
Your program is just saving the old vector (usually used by the system for many things) to
set its own , and then put back the original one.

: (Paul Civati) writes:
: |> Can some explain how to work out clock cycles?
Not exactly answering this question, but if you want to work out
which piece of code is faster I use a really simple approach.

I write a little program that runs thru lets say 1 Mio loops of the
little assembler piece and time this with GULAM (time foo.prg).
The I try an alternative piece and compare the times.

You get cachetimes of course (on a 030) if you dont turn off the
CACHE. There are interesting differences depending on screen-
resolution and the number of bus accesses. There are also subtle
influences if you use two buffers with CACHEs enabled and both hit
the same cacheline (one read one write).... So you should look out for
this, or disable the datacache.

Alternately of course one picks up a reference book of the desired
Microprocessor and does the cycle counting oneself.

On the ST-68000 it's shiteasy, you figure 4 cycles for every bus-
access (instruction and data) count the number of word or byte
accesses and your there in 90% of the cases. (I think add 4 cycles
for longword arithmetic)

4673. Flicker problems on TT

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-05 23:58:31 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <CvoL9J.66t@cix.compulink.co.uk>
Source record: 30655

I've just bought a TT system second hand.

My TT HiRes screen (ProScreenTT) gets a definite vertical flicker/jitter/wobble after about an hours use. The VGA colour picture is none too inspiring either, with a slight horizontal flicker from turn on.

Its been suggested that my TT PSU is suspect. Does this sound likely? Also would it be worth me buying a PC PSU and wiring that in instead (I'd have to mount it external I know)? Has anybody here changed the PSU in a TT? Is there anything I should watch out for?

BTW the TT PSU has apparently been suspect in the past. At one time it needed several attempts to turn on according to the previous owner.

Thanks

Roland.

@CiX

4674. OverscanTT

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-05 23:58:33 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <CvoL9L.67E@cix.compulink.co.uk>
Source record: 30656

Has anybody had any experience of the OverscanTT display enhancer? Mainly what exactly does it do, and is it worth fitting? Also how easy is it to fit?

Thanks

Roland.

@CiX

4675. TT SCSI interface

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-05 23:58:36 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <CvoL9o.68L@cix.compulink.co.uk>
Source record: 30657

The TT SCSI interface seems to have the same conector as the Apple one. Is that correct? Also should SCSI devices on the TT port have parity enabled or disabled. Finally what should the correct parity setting for the ASCI port be?

Thanks

Roland.

You could use MOVEP on <020 then, no? Sorry, don't even have assembler
ref to have, and have never needed to find out exactly how movep works,
so I can't be more precise.

I think Turtle puts the files onto floppies that are regular TOS formatted filesystems. If this is the case, it is likely that only the bootsectors of the floppies need to be changed to make them fully MSDOS compatible. There are several ST utilities to do this, as well as an MSDOS program called st2dos. You can find the latter on atari.archive.umich.edu in /Misc.

Also, if you have mtools, you could probably hack the "mformat" source to only write an MSDOS bootsector (and not rewrite the FATs and directory entries). This should also cure the problem, though I would proceed with caution. Good luck!

> Thanks in advance.

Are you sure you don't have one of the MMUs that can only access the first
bank of memory (thus restricting the machine to 2mb, unless you replace the
MMU)? I think the part number for the "bad" MMU has been posted here before,
but I don't have it. This is a problem that effects quite a few Mega2's,
I hear.

>date, or just a load of rubish...??

This is from the 'Atari ST Profibuch' (German), IMHO the best ST reference
work.

Process Descriptor (Basepage):
$0 p_lowtpa Start address of TPA (Transient Program Area), i.e.
points to this very location
$4 p_hitpa Points to after TPA (so p_hitpa-p_lotpa is the total
memory allocated to the program)
$8 p_tbase Start address of text segment (program code)
$C p_tlen Length of text segment
$10 p_dbase Start address of data segment (constants)
$14 p_dlen Length of data segment
$18 p_bbase Start address of BSS text (variable data)
$1C p_blen Length of BSS segment
$20 p_dta Points to default DTA. Warning! Initially points to
p_cmdlin, so the first Fsfirst/Fsnext overwrites
the command line.
$24 p_parent Points to PD of parent process
$2C p_env Points to environment strings
$30 p_devx[6] real file handles of the six standard devices
$37 p_defdrv Number of default drive
$80 p_cmdlin[128] Command line arguments. "Pascal" style: first character
is length of the string. Maximum length 124.

Note that the command line isn't split up in separate argv strings yet.
This should be valid for any TOS version.

Hope this helps,

For the TT parity doesn't matter, for ACSI most host adapters need parity to
be switched off.

I don't see any problem at all using mtools for TOS formatted disks. I have
been using it for this purpose for years now. When compiling mtools you can
configure it for nearly any format you can think of. BTW, disks formatted
with TOS >= 1.04 are DOS compatible anyway.

4691. Hard drive problems...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-06 13:23:49 UTC
From: P.A.Booth@bradford.ac.uk
Message-ID: <1994Sep6.132349.15518@bradford.ac.uk>
Source record: 30672

I recently got a fujitsu m2249sa drive 2nd hand which has been formatted
on a PC. It has all the terminating resistors and stuff installed, and
when I run icdboot with it, the drive is recognized and it's ID is shown
on screen....
It also seems to format ok, with what would seem a fair number of sectors
for a drive that size (it's approx 330meg).
The trouble is, when I come to partition it with ICDformat, it gives me 0
for the size of the hard drive, and when I tried HDX with it, it told me
that sector 0 was unreadable.
I was using ICD pro utils and a version of HDX from a.a.u.e.
All 8 jumpers at the back of the drive are up...
There are 3 marked ID, three marked PA and two marked SD, would these have
any bearing on the problems?
Like I said, it does seem to boot up but then won't read the size of the
disk so I can partition it...
I've tried it both with a BMS-100 host adaptor and an atari card from an
SH204...
Is the drive knackered or am I missing something important?

Does anyone have any ideas? :(.

Cheers in advance.

Paul.

wonders why nothing is ever easy

Did you remember to add the 2 or 3, 33 ohm resistors? They are
normally located near the front of the mother board roughly in the
middle.

Dave.

I upgraded my old STFM in exactly this way. I got an upgrade kit, which
had the 16 RAM chips, 16 capacitors and a couple of resistors. I think the
resistors are there so that the extra RAM can be seen, but I remember the
intructions say that some boards have them anyway.

Be warned: desoldering those holes takes a LONG time. So does soldering the
chips in.

>What is the "piggyback" memory upgrade that I have heard mentioned previously?

That might be the upgrades with a socket that sits ontop of the MMU and
Shifter, though this is just a guess.

You can exchange the PSU quite easily for a PC power supply as the
connector is quite standard. I've put in a XT power supply (150 watts) into
my tower and could plug the connectors straight into the TT's motherboard.
An AT power supply should fit also, just remember to keep that black leads
together of the two separated connectors of the PC power supply. The TT
power supply has one single large connector but the color scheme of the
wires should be identical.
Mind this however, as you put the power supply outside the TT's case, the
harddisk will not get it's share of fresh air and could become 'cooked' !

Gert

>they actually did fix it?

The mod for machines which had this problem involves wiring a
chip positioned above U63 and the removal of some surface-mounted
resistors in this vicinity.
>
>I also asked them to bypass the bass boost. How can I tell if they did that?
>
The components involved are surface-mounted on the underside of
the motherboard, so it may be difficult to see any changes made
unless the board has been removed completely. Perhaps some indication
may be obtained by doing an A/B listening comparison between the
'original' audio material and the same material as it appears at
the Falcon output. After doing the audio mods on my machine, I found
it very difficult to detect any difference between the input and output,
whereas before doing so there was a marked difference in the output,
which sounded to me much like the same effect as the 'loudness'
switch on an amplifier has, particularly in the bottom end.

Interesting. I always thought this points to the environment of the
process in any case.

4698. Prospero C problem...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-07 09:11:50 UTC
From: lstanley@central.susx.ac.uk
Message-ID: <34k04m$j1j@infa.central.susx.ac.uk>
Source record: 30676

Hi there,

I've just started to program in 'C' and am using Prospero C as this was given away on an STR coverdisk. I am using a 4Mb STe TOS 1.6.

I have a problem that as far as I can see shouldn't arise from the code. What the program does (quite inane really...) is to input 5 names via scanf("%c") and five numbers via %d and store them in an array of 5 structures.

When this is done, the names and numbers are listed back again. There is then the following exit loop:

```
void bye()
{
printf("Again..y/n"); /* This prints twice, why?? */
switch (ex=getchar())
{
case 'y':
printf("running again");
job(); /* The procedure that calls input/list
case 'n': functions */
printf("\nExiting...");
break;
default:
bye(); /* This procedure */
}
}
```

If I answer Yes to the prompt, the program runs again, and then EXITS without prompting...

I initially thought it was because the variable ex was set to 'y' from the previous time but surely ex=getchar() redefines ex.

Any suggestions.

Thanks for your time

Laura.

|> Process Descriptor (Basepage):
|> $10 p_dbase Start address of data segment (constants)
|> $18 p_bbase Start address of BSS text (variable data)

These are both variable data, but the data segment is initialized from
the program file, whereas the bss segment is simply set to zero.

MOVEP can only operate on memory and is rather slow compared to
ordinary MOVE. If you want to swap bytes in a register it is always
faster to use ror.w #8,d0 than to go through memory, even on a plain
68000.

i would like to delete a block in a huge file (soundfile).

```
|---------------|----------------|---------------| (old file)
start blockstart blockend eof

|---------------||---------------| (new file)
star (blockend) eof
```

my idea was to copy the block (from blockend to eof) to the position blockstart
and free then the reminding space. but how can i set the eof myself? any idea?

```

>If I answer Yes to the prompt, the program runs again, and then EXITS
>without prompting...

That's because, after finishing job(), it returns to just after where job() was called, and not finding a break it continues with case 'n'. Remember you *must* put breaks between case-statements if you don't want all cases following the selected one to be executed too.

>I initially thought it was because the variable ex was set to 'y' from
>the previous time but surely ex=getchar() redefines ex.

But bye() doesn't get called after a 'y'. It just continues where it was interrumped.

>Any suggestions.

You might want to change the way you check for illegal input (i.e. nor
a 'y' nor an 'n'). Everytime you press an `illegal' key, the function
gets called again. This might fill up memory, though it's not very
likely that it will cause problems. Try this:

```
...
default:
bye();
printf("This line appears once for every illegal keystroke\n");
}
}
```

When you press an illegal key in your version, the function gets
called again. If you press an `n' then, "Exiting..." will be printed
and the function ends, *and then returns to just after the bye() that
called it!!!* Because there's nothing after it, you won't notice it.
If you add above printf, you will see the effect.

>Thanks for your time

Any time!

>Laura.
Greetings,

On the normal TOS (GEMDOS) filesytem this is impossible, you have to
copy the whole file, or put a special marker in it. But under MiNT and
with the Minix filesystem you can truncate a file at an arbitrary
position. The MiNT library contains the functions truncate and
ftruncate (the first expects a file name whereas the latter operates
on a file descriptor):

```
int truncate (const char *name, off_t length)
int ftruncate (int fd, off_t length)
```

I have a hard drive which is in a case that has room for another one. If I wanted to insert another hard drive in there would I need to buy a new controller for it or would I be able to use the existing one.
The hard drive is 170Mb and I have partitioned it to go from C-M. What I want is a smaller drive, say 20Mb, that I can use as partition N-O, leaving P for things like ram disks. I want to do this without re-partitioning my existing drive.

Thanks for any help

hmm, interesting, I have a mega 2 st as well, lucky to have read this post,
was just about to upgrade my machine. I also have a standard stfm with 2.5
mb in it, would I be able to swap mmu chips?. I would be willing to sacrifice
the 512k in the upper bank on the fm inorder to get 4 mb on my mega.
I might just sit on this one for a while though so if someone could
please post the part number of the 4 mb mmu I would greatly appreciate it.
Also whats the going rate for 51100 (or equivalent) ram chips at the moment,
Last time I checked the price was much higher (per mb) than simm modules,
has this changed ?

Thanks in advance.

This is interesting.

1. What's a PSU? [sorry]

2. I'm having similar problems with my Spektrum 1 board. Two problems
both occur after some time [an indication that heat has sth to do
with it, I suppose]. First of all in 1024x768 (which is pretty
high for the Spektrum) I get wobble, i.e. sort of 'walk like an
Egyptian'. Second, sometimes faulty pixels are left on the screen.
(the mouse leaves a trace of black, white, green and purple
dots, even in monochrome mode!) The faulty pixels seem to be
stored somewhere nonetheless, as they remain on the screen!

Just hoping I am getting closer to finding what's causing the problems
Wilhelm Mikroelektronik doesn't seem very eager to provide a solution.
All they could give for an explanation was 'This is curious. Spektrum's
timing is very delicate.' Well, I guess it is all in my timing's
being kind of coarse, then :-)

Message-ID: <34ki0j$r9u@msuinfo.cl.msu.edu>
Source record: 30687

Hello,

Thanks again to everyone who responded to my last question (where I hadn't included '-lgem'). I now have another problem.

I got the program up and running, and have added a function which sets the title and info of a window, opens it, performs a simple FOR loop (from 0 to 1000), closes the window. The first part of the program calls appl_init() and opens a virtual workstation, while the last part closes the virtual workstation and calls appl_exit().

The program compiles and links without a problem, and I can even run it once (though it doesn't seem to perform the FOR loop). The next GEM program I try to run, whether mine or any other GEM application, crashes with two bombs immediately after being loaded into RAM. Gulam and TOS programs will still run without any problem.

Does anyone have any suggestions to fix this? Or would anyone be willing to look at the code (it's very short and basic :-) to help me out?

Thanks,
Tom

If it's a standard host adapter such as an ICD AdSCSI then there is no
problem. Just add another connector to the SCSI bus ribbon cable and plug the
new drive into it. You'll have to set the ID of the new drive to something
unused, i.e. not the same ID as the drive you have already.
You set the ID by the jumpers on the drive unit itself.

Although I can't speak from experience, this should work with any brand of
host adaptor.

>The hard drive is 170Mb and I have partitioned it to go from C-M. What I want
>is a smaller drive, say 20Mb, that I can use as partition N-O, leaving P for
>things like ram disks. I want to do this without re-partitioning my existing

This is easy, at least with ICD's software. Each physical drive is formatted
and partitioned seperately. For instance, I have one 100Mb Quantum drive
as partitions C to G and my old 50Mb Seagate as partitions H and I.
No repartitioning is neccesary.

Hope this helps,

Seems like your program is exiting before the '1 to 1000' loop and forgets
the 'close workstation' etc. This leaves GEM rather confused..

But the computer was OK when I got it. I think I must have `busted' the sound system by connecting audio equipment of the wrong voltage or something like that.

Do you, or anyone else, remember more specific what kind of fault there was in the dutch computers?

>>What is the "piggyback" memory upgrade that I have heard mentioned previousl

A piggyback memory upgrade was popular on original ST and STM machines
(before STFMs came out). It involves piggybacking the second 16 chips on
top of the first 16! Most of the pins are just soldered together, but some
of the address ones are bent out and snipped. Onto the end of these pins
are soldered lengths of wire that then go back to the mother board.

Definately not for the faint hearted, and not to be advised nowadays.

:-)

Roland.

It looks to me like the problem is when you select 'y' the program execution goes to job(), then returns and falls through to your 'case n' code. You need to 'break;' or maybe call bye() again. Also, depending on your job() code, the newline left in the buffer from using getchar() could be causing you problems.

BTW, how is Prospero C? Did it come with good docs? Where can I get the STR coverdisk?

It depends on your controller. With an ICD AdSCSI(+) it should work, but
certain other host adaptors are 'one drive only'.

Also don't forget to check the size of the PSU. Although it may be big
enough to run both drives, it might not be big enough to start them up at
the same time. Some hard drives have a 'delayed boot' jumper. Alternatively
a manual switch might do the job.

> default:
> bye(); /* This procedure */
> }
> }
>
```

Well you seem to be missing a break after job() for starters. Without this after exiting job(), the program will fall straight through and drop out through default:

Actually now I've had another look at it, I see the function is recursive (ie it calls itself). Was this intentionally? Everytime bye() is called from within bye() it consumes more memory. Then when you exit bye() the program just returns to the previous bye(). This technique is great for doing some things, but not for deciding whether the user wants to go round again.

The reason "Again..y/n" prints twice is probably because getchar() returns a rubbish character first time around (ie not 'y' or 'n'), so the code just falls through default: back into bye() again - which prints the message out!

How about:

```
void bye()
{
char ex='y';
while (ex!='n'){
printf("Again..y/n");
switch(ex=getchar())
{
case 'y':
```

```
printf("running again\n");
job();
break;
case 'n':
printf("\nExiting...");
break;
default:
break;
}
}
```

There are probably a few typos, and I don't know off hand whether getchar()
return a char or some sort of int. Also its probably not a good idea to
do this sort of stuff in the bye routine. This is more like main() stuff:

```
int main()
{
char ex='y';
int first=TRUE;
while (ex!='n'){
if (!first){
printf("running again\n");
}else{
first=FALSE;
}
job();
printf("Again..y/n");
ex=getchar();
}
printf("\nExiting...");
}
```

This looks *too* short, but I can't think what I've missed! ;-)

Anyway hope this gives you some ideas.

:-)

Roland.

Hence the Jargon file reference to The NUXI Problem?

Some ICL machines also have a big-endian bit addressing scheme which is pretty unique. Bit #0 is the MSB of a 32-bit word rather than the LSB as it is on most other architectures.

John

A better solution perhaps, this will compile automatically depending on what compiler you use. Basically just define the prototypes in enclosed in one of the __TURBOC__ #ifdef's. You will need to seperate #ifdef's for each function header, one for K&R HSC and one for ANSI Turbo C.

```
#ifdef __SOZOBONC__
/*
Only compile this code under HSC
*/
#endif

#ifdef __TURBOC__
/*
Only compile this code under Turbo C
*/
#endif
```

__SOZOBONC__ and __TURBOC__ are defined automatically by their respective compilers.

You can tap off the VIDEO signal at the monitor plug. Just look at the
pin-outs
in the Atari STE manual, find the VIDEO, and use Ground for the shield
wire. Before I got Monitor Master, which has the video tap available in a
convenient RCA style jack, I put mounted my own RCA video jack to the
backside, and hardwired it to the two pins I described on the monitor plug.
It's a true 1 volt p-p Video signal, with color. You can video tape this,
no problem.

I have an old ST color monitor, vintage sc224 or something like that. I was wondering if anyone might have an old manual laying around which would have the IDs for the cable pin numbers... all 13 of them... I'm trying to put it to some use with a PC laptop. For all I know it's not even possible without some additional video card, but I figured I'd give it a try. If anyone can forward the pin numbers or some advice, it would be greatly appreciated.

I have a 540Mb SCSI-II harddrive, formatted to 4 partitions, as follows:

(Starting on F since I have another HD as C,D and E)

F: 50Mb
G: 120Mb
H: 120Mb
G: 250Mb

Is it possible to hook this beast up to a PC (with a SCSI-card ofcourse .. ;) without re-formatting it, and use all the files that's on it straight away - no fuss?

I suspect all partitions are BGM, and I really don't think MS-DOS knows what that is .. ;)

Is it possible to convert without losing the data?

Please help, I'm going to move my BBS from an Atari STE to a 386/486, and there's no way I can temporarily store all these megabytes of data if I have to re-partition (format?) the drive ...

I never heard of those MMUs, but there are the 'famous' IMP-MMUs, which
you can easily recognize by the manufacturer's logo 'IMP' on the chip.

The IMP-MMUs (part-number: C100109-001) can handle only one ram-bank
_OR_ two equally equipped ram-banks. So there's no problem to add a
second 2MB-bank to a Mega ST2 with an IMP-MMU. Only mixed versions
(512K/2MB) are not possible. The IMP-MMUs were often used in 1040 STs
and Mega ST1's which had the (512K/512K)-configuration.

Put another \n on the end of the again

> job(); /* The procedure that calls input/list

Insert a 'break;' here!

> case 'n': functions */
> printf("\nExiting...");

Move the '\n' to the end of the string. Then try something like
'exit(0);' to actually make it exit the program.

> break;
> default:
> bye(); /* This procedure */

For style reasons, you should insert a break here as well.

> If I answer Yes to the prompt, the program runs again, and then EXITS
> without prompting...
> I initially thought it was because the variable ex was set to 'y' from
> the previous time but surely ex=getchar() redefines ex.

It's because of the lack of the first 'break'. job() gets executed,
then control jumps back to bye(), and because there's no break;, it
just goes on to the next bit in the switch statement, which is the exit
handler.

ATB,

Martin

It's the same on the 680x0 (where x >= 2) with the bitfield
instructions, bit #0 is the MSB, contrary to the single-bit
instructions, where bit #0 is LSB. Is the 68000 a mixed endian cpu? :-)

Ludo says: If you have any company which sells atari's in your neighborhood,
you can ask them to send it to ATARI for you (germany would do the same thing).
I did it once with my portfolio which I bought in germany too, and a dutch
company send it to ATARI. It would cost you less. A motherboard cannot be
bought seperately from ATARI, but mine was replaced out of guarantee period
with costs of 250,- dutch guilders (about 130 us $ i guess?). This included
labor and taxes.

> I _DO_ have reason why I do what I do - I just can't remember them
> ---
>

Ludo says: depends on the controller you have installed with your harddisk. There is one controller that I know off that only accepts one harddisk to be installed (but says so clearly in the manual), but in all other cases it shoudl be possible to connect to max. of 7 devices to your ATARI. You don't need to repartition your existing drive, for the new drive letters will follow up the existing drive identifiers. Just plug your new harddisk onto your 170Mb drive, and it should work (don't forget to set the jumpers)

Hopefully this helps,

Hi!

I would like some help with bit graphic enlargment. Is there any
standard algorithms for enlarging/shrinking bit graphics?

My actual problem is enlarging one line of bytes by a factor approx
1.7 But if there is faster methods on 1.6 or 1.8, that's the thing for
me since this has to be the fastest possible method!

Could somebody just tell me a algorithm for this simple task (2:1) too,
I would be very happy!

01010011 00111001 Original bit graphic line, 2 bytes

00110011 00001111 00001111 11000011 Enlarged 2:1, 4 bytes

And the key word is: FASTEST POSSIBLE!

Greets from

>Seems like your program is exiting before the '1 to 1000' loop and forgets
>the 'close workstation' etc. This leaves GEM rather confused..

Yeah, that was kind of my impression, too. I don't see how that's possible, though. The lines to open, loop, and close the window are:

```
wind_get(0, wf_wxywh, &xfull, &yfull, &wfull, &hfull);
whand[i] = wind_create(parts, xfull, yfull, wfull, hfull);
wind_set(whand[i], 2, &title[0], 0, 0);
wind_set(whand[i], 3, &info[0], 0, 0);
wind_open(whand[i], x, y, w, h);
for (a = 0; a <= 1000; ++a)
b++;
wind_close(whand[i]);
wind_delete(whand[i]);
```

That's it, verbatim from the code, without any modifications or deletions. Is there anything wrong with it? After this part of the code (which is in a function, there's a 'return 0' to "main," which then calls another function which calls v_clsvwk(handle) and appl_exit().

Thanks for your help.

Newsgroups: comp.sys.atari.st
Organization: University of Kent at Canterbury, UK.
Distribution: ukc
Summary:
Keywords:

I'm having problems with internal floppy drives on my ST, and I wondered if anyone could help.

I have an old 1040STF, that I use for spare parts, and today I took out its internal drive to replace the knackered one in my 1040STE. After a bit of hassle I got it into the STE, only to find that the drive sat too high in the STE case. Looking at the 2 cases I could se why, the top parts were sculpted differently.

Apart from using the STF case on the STE, I can think of no solution. Can anyone else?

If so, could you reply by email if possible.

Thanks in advance.

You could alway replace the floppy mounting screws, and spacers, with ones
that would lower the drive to the desired height. The parts should be
available at any hardware store. I would get the plastic spacers, so you
can reduce their height with a hack saw or file if you need to.

I've done it for other people.

4739. Help with vector redirection

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-08 15:46:11 UTC
From: "S.J. Harrison" <S.J.Harrison@ncl.ac.uk>
Message-ID: <34nbk3$3io@whitbeck.ncl.ac.uk>
Source record: 30514

Can anyone help with a problem I have concerning vector redirection? I have written a program (which works perfectly well from the desktop) that redirects two extended system vectors ($100 & $101 - 50Hz timer and Critical Error Handler). The redirection is performed with a BIOS call - I think (X)BIOS #5. I am inserting my routines in series with the existing ones so the original value is stored and called on exit. As I said before, this works OK from the desktop, provided the program is executed as a .PRG. If it is renamed to .TOS, the vectors remain unchanged. If I run the same program (as .PRG) from the AUTO folder at boot up (what I wish to achieve), the vectors also remain unchanged. The code the vectors point at is exited with a TSR call so remains in memory permanently.

Can anyone shed some light on why the vectors are not always changed? I have tried writing directly to the vector locations from the AUTO folder, but assume that these values are overwritten when the AES boots up. How can I therefore alter (permanently) these vectors from the AUTO folder?

Any comments appreciated.

Thanks,
Simon

What happened to the 386 emulator ? I believe a 486 would have a price
of an full 80846Dx system, and i would rather buy a new PC than spending
the same money on a exstra card which gives me the same.

Will it cover a full Intel 486 ? What about the speed ? And last, a price
of couse ? 8-)

>fuss?

No, it isn't for two reasons:

1. The PC wo't recognize Atari partition tables.
2. DOS Partitions > 32 MByte differ in layout from TOS partitions

If you want to access partitions from DOS and TOS they have to be < 32 MByte
and have to be DOS partitioned. AHDI and some other hard disk drivers
recognize DOS partition tables. But more than 32 MByte per partition won't
ever work because GEMDOS can't handle this. (Hard disk drivers, i. e. the
BIOS can.)

Umm. I think it's something to do with certain GEM calls resetting certain
vectors - I can't remember the exact details.
There is a way around it. You should read the 'Ten Commandments' file by the
Codeheads which details all this stuff. The only problem is, I can't remember
where I got the file - I _assumed_ it was on atari.archive, but now
I can't find it.
Well, if you can find the file, I'm pretty sure it will solve your problem.
Good luck!

Glad to hear somebody has done it! I have a 150W PC PSU on order. Don't
know if it is an AT or XT one though.

>An AT power supply should fit also, just remember to keep that black leads
>together of the two separated connectors of the PC power supply. The TT
>power supply has one single large connector but the color scheme of the

Not entirely sure what you mean here. I know the TT PSU has a single 12
pin plug, and the PSU I've ordered has two 6 pin plugs. I assumed I was
going to have to wire a new 12 pin plug up the same way as the existing
one. Are you saying that two 6 pin plugs end to end have the same wiring
as the 12 pin one?

Also I notice the TT PSU screws into the motherboard. Is it necessary to
connect any leads from the PC PSU case to these screw holes in the
motherboard? Alternatively can I just get away with wiring up the 12 pin
mothrboard connector and the disk drive power sockets?

>Mind this however, as you put the power supply outside the TT's case, the
>harddisk will not get it's share of fresh air and could become 'cooked' !

Yes - I've thought about this. I wouldn't have thought the harddisk got
much air from the PSU fan! However I was thinking of mounting a small fan
behind the grill on tha back of the TT, where the original PSU fan sat.
Does this sound sensible?

Thanks

:-)

Roland.

> My actual problem is enlarging one line of bytes by a factor approx
> 1.7 But if there is faster methods on 1.6 or 1.8, that's the thing for
For resampling to any new resolution use a Digital Differential Analyser -
I'll post one that should do the job tomorrow if I can.

Each bit in the input stream needs to get repeated x times, where:
floor(ratio) <= x <= ciel(ratio)
The DDA decides whether you need to repeat the bit floor(ratio) or ciel(ratio)
times this time round, so the resulting output stream will on average have
bits repeated (ratio) times. This is reasonably fast but still has a fair
amount of overhead.

For a fixed (but non-integer) ratio like 1.6 or 1.8 you myo be able to
optimise this slightly:-
Ratio = 1.6 => Each bit is repeated at least once, and bits are
repeated twice .6 = 60% of the time => they are repeated once 40%
of the time. This gives you 3 doubled, 2 single, 3 doubled bits etc...

Ratio = 1.8 => Same as above but bits doubled 80% of the time. This
gives 4 doubled bits, 1 single bit, 4 doubled bits etc...

Unless the ratio gives you some nice numbers (like the total number
of bits in the generated non-repeating pattern (for 1.6 above this is
(3*2)+2=8) is divisible by 8), in which case you can calculate each
output byte quickly and store it, you will probably have to
generate the output by shifting bits out of the input, and then shifting
then into the output x times.

If you know that ratio before compiling, or know certain ratios are going
to be common you can code them in this way, otherwise I think you will
have to use the DDA.

> Could somebody just tell me a algorithm for this simple task (2:1) too,
> I would be very happy!
>
> 01010011 00111001 Original bit graphic line, 2 bytes
>
> 00110011 00001111 00001111 11000011 Enlarged 2:1, 4 bytes
>
> And the key word is: FASTEST POSSIBLE!

This is small enough to do by a lookup table - each byte in the input stream
expands to a full word in the output stream:

```
lea input,a0
lea output,a1
```

```
lea table,a2
move.w #no. of bytes to do-1,d7

lp:
moveq #0,d0
move.b (a0)+,d0
asl.w #1,d0
move.w (a2,d0.w),(a1)+
dbf d7,lp
rts

; 512 byte lookup table (one word for each possible byte)
table:
dc.w 0,$3,$c,$f,$30,$33,$3c,....
```

Or similar... You could even go as far as a 256k lookup table storing the bit-doubled longword for each possible input word. (On a 64-bit machine you could use a 32Gb lookup table storing a value for each possible long-word input if you REALLY need the speed.)

Hi Adrian, you might try checking with ICD to see if they have any of their internal host adapter kits in stock. You can write them via the Internet at icd@genie.geis.com

The only companies that I'm aware of that ever produced an internal HD for the Mega ST were Supra and ICD. I'd be really surprised if Supra still had any. 99% of their business right now seems to be modems for PCs and Macs.

While chatting with ICD, check out the price of THE LINK, their plug and play host adapter for SCSI drives. Over on this side of the pond, the price of SCSI drives is dropping like a rock. You can purchase a very large drive for quite a reasonable price, about 60 cents per meg (less if you shop carefully!)

regards,

Bob Brodie

4747. 1STGUIDE..

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-09 02:21:02 UTC

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Some one e-mailed me and suguested that I should be using 1STGUIDE
and not GUCK as it was far better...

1. I don't use a TT or a Falcon, so how can it be better..

2. Doc's are very German and very hard to understand..??

3. It has none of the features that GUCK has, scroll with the mouse,
find a text string, display IMG pics, Signum fonts....

So I can't see 1STGUILD being better than GUCK, also 1STGUIDE is a ACC
and takes up memory, GUCK does not do that....

So how come some one can claim that 1STGUIDE is better than GUCK
and a standard ST/STE/MEGA running TOS or Neodesk..??

"G> after about an hours use. The VGA colour picture is none too
"G> inspiring either, with a slight horizontal flicker from turn on.
"G> Its been suggested that my TT PSU is suspect. Does this sound likely?

before going for a new PSU might be worth giving the socketed chips a good press and the other connectors a look at aswell . I suffered from Monitor wobble with my ST and even complete breakup of the screen during disk access sometimes. I don;t know what it was but after opening up the case and doing the above normal clarity was restored :-)

After countless removals I found the plastic plug that takes the power onto the motherboard got a bit trashed on my ST (don't know if this is still present on a TT) and the wires didn't sit that tight in the sockets
and caused previous problems with sound breakup and screen interference.

always better to try the simple things before going for costly and perhaps uncalled for expense !

Hi all of you!

Can someone give me a clue of what soft- and hardware is available
(incl price tag) for Falcon in the area of hard disk recording.
I have a DAT, in my homestudio, that is equipped with optical in, out
+ digital coax in. Is there anything developed that lets me do hard
disk recording on say 8 tracks on a Falcon and then do a mix down
to DAT ? That would probably make me switch from my old, but trusty,
ST to a Falcon. The sound quality must of course be good. No noise please :-)

E_GEM version 2.0 is the latest version and version 2.1 will be out soon,
unfortuantely there aren't on ftp yet, but you can send a public domain program
to the author, then you will get the latest version direct from him (see the docs
in e_gem 1.4!)

4753. Help needed for XBIOS(11) and BIOS(0)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-09 08:41:00 UTC
From: schauvea@irisa.fr
Message-ID: <34p72s$p5i@irisa.irisa.fr>
Source record: 30531

In the falcon TOS 4.2, there is an undocumented XBIOS(11,(int) mode, char *str) call.
In GEMDOS's calls, this function is called with 'mode'=5 and
'str' looks like "print malloc -x Lpeek('a6 + 8)" (It isn't an exact string)
It is probably a debugging function.
I would be greatfull if someone can give me a doc of this function.

A second question : I have the PUREC with a german doc and I can't
understand the GETMPB call (BIOS 0). Can you help me ??

Stephane Chauveau. (schauvea@irisa.fr)

4755. New Quantum HD that won't go!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-09 11:03:42 UTC
From: mad_man@pc.unimelb.au
Message-ID: <mad_man-090994210343@mg4_65.its.utas.edu.au>
Source record: 30444

I've just purchased a new 340Mb Quantum LPS 340s (I think that is the model, but I haven't got it on hand so I can't be sure). Here's my problem. I have a fairly old SupraDrive with a 20Mb Miniscribe mechanism. I have the version of the Supra host adaptor that has an on board clock and a SCSI port for daisy chaining. Also, I'm using the ICD Pro utilities.

Now when trying to format the drive with the original mechanism removed I discovered that it could see something was there but the poor old ST had no idea what. It seems to think that something is there as the boot program says ID 0 (not recogizable) and the ID checker had an extended pause when checking devices over ID 0 respectively. However, if I try to format it, it can't find the mechanism at all. Just for the record, I've got a 4Mb blitterized STFM with TOS 2.06 and 1.2

I know the drive works as I took it around to a friend's house and formatted it on his Amiga 3000. Now the interesting thing is that I was explicitly told it was a SCSI drive when, in fact, it comes up as being a SCSI 2 on the Amiga and I'd like to know if this could/should/does pose a problem?

Does this series of Quantum drive need any software fixes or hardware settings changed (other than the SCSI ID that is)?

If it isn't the drive itself then does the problem lie in either the host adaptor or it could be terminating resistors (my friend told me the latter and I don't know anything about them and neither does he really). So could someone tell me what terminating resistors are please! Is it that Supra host adaptors (or maybe the ST itself) are incapable of using a SCSI 2 drive?
If anyone else has had this problem could you please respond to me as this is very frustrating having spent quite a bit of cash on it. If SCSI 2 does not work with this adaptor, could anyone tell me of any host adaptors (and where I might obtain one (prefer Australian but others OK too)) that work well, have a clock on board and extra SCSI ports? I am prepared to buy a new host adaptor if this is necessary.

And just to increase my SCSI knowledge a bit. Does anyone know how compatible SCSI 2 devices are with SCSI devices, what are the main differences and what on earth do terminating resistors do?

Please post any response to this newsgroup as I sure there are others that may run into similar problems with the increasing use of SCSI 2. (You can also post to my E-Mail address if you like.)

I would really appreciate any help that anybody can give.

Anthony Green

Hi,

1st Guide (Shareware) actually isn't a pure file viewer. 1st View (PD), which is a subset of it, is rather comparable with GUCK.

1st View does all of its output in GEM windows - this grants highest compatibility with MultiTOS, MagiC and all screen resolutions that one can imagine. So 1st View is very independent from the hardware/software environment.
This only becomes unimportant if you definately know that you are _never_ going to upgrade your computer (or OS) or purchase another one.

1st View is able to display text in a scrollable window in different font sizes, (X)IMG pictures, GEM Metafiles, .RSC files and a certain sound sampling format (I don't know it right now).

1st Guide does the same but also has Hypertext features built in and comes with a hypertext document which explains TOS (very useful for programmers). I have registered it as an application under Gemini and renamed it to .PRG instead of .ACC, as I use MagiC and can let it run in parallel. That way, it doesn't take up memory and displays automatically the contents of a file by a double click.

Have you already asked the author whether he is willing to translate 1st Guide/1st View and the documentation?

Bye,

Christoph

4757. Re: [SUMMARY] re: Wanted: UNIX program to access TOS disks

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-09 12:18:29 UTC
From: crath@bnr.ca
Message-ID: <CRATH.94Sep9081829@bcaricbe.bnr.ca>
Source record: 30538

Thanks to all who replied. Most of the replies are appended to this message. I still have not been able to read a disk, although michal@gortel.phys.ualberta.ca has said that he was able to get MTools to read TOS disks (by expanding one of MTools' internal data structures). While I have now been able to get MTools to accept a TOS disk (that has more sectors and tracks than a standard MS-DOS disk), MTools still doesn't find any files on the disk. Further hacking is required.

My comments accompany the attached messages.

Christopher

] > sectors, tracks, etc. fields it came up with impossible numbers in the
] > hundreds.
]
] If you are getting some crazy numbers then maybe your backup program
] was writing diskettes "raw" and they are not really TOS diskettes. Do
] you have any ST around to check them out? If they are really TOS,
] then a reported disk capacity should give you an idea about a number
] of sectors in question. I could not tell. Since you can obviously

] can read something from your floopy device, then you may use 'dd' to
] raw-read fragments of your diskettes and check them out. Maybe you
] can even restore an info you are after that way? Requires continuous
] file images and a reasonable editor, but emacs should do it.

Turtle (the program I used to write the TOS disks) just creates normal
TOS disks, not "raw" disks, so it should be possible to get MTools to
read the disk as Michal originally suggested. I will continue to
pursue the MTools option.

4758. Re: printing IBM files on Falcon + laser

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-09 12:33:58 UTC
From: c0031098@ws.rz.tu-bs.de
Message-ID: <34pknm$ji5@ra.ibr.cs.tu-bs.de>
Source record: 30539

Denis Sevee (dsevee@CAM.ORG) wrote:
: I have a 386 and a Falcon. The Falcon is hooked up to an Okidata
: OL400e laser printer (hp compatible). If I print to a file on the
: 386, how do I then get this file printed from the Falcon?
: dsevee@cam.org

Well this is a delicate problem.

I assume both computers have 3.5" HD (1.44 MD) Floppies.
Now you copy the file to a PC-Floppy using something like:

copy /b c:\mypath\myfile.pcl a:
(The /b is importand!)

Then you take the disk to the falcon, open drive a:
and double-clik on the file. You ought to get a dialoge
asking what to do with the file:

print | show | abort

select print and the chance is high it will print on the oki.

If the file is larger than 1.44 MB (printing from WINDOWS
makes sure it is) you have to compress it first.

I suggest using PKZip on the PC and STZIP 2.6 on the Falcon.

If the compressed file is larger than 1.44 MB you have to
connect the computers via serial-line and use a terminal
programm to transfer files.

(Or use MiNT-net and PCTCP/IP and mount the PC-HD to the
U: filesystem. Type cat /nfs/mypath/myfile.pcl >/dev/prn at the
shell prompt. You might want to add a & to put the cat in the
background.)

A standard pc 1.44 mb drive will work in an st, the st thinks its a
720k drive. These are becoming dirt cheap, new I can pick them up for about
$60 aust. I saw one running in a mega st without any problems. The owner
of the mega plugged it staight in and sure enough it goes. These drives are
in the same height case as the original ste epson drives.

Hope this helps.

Not-For-Mail@rubb.Rz.Ruhr,
In a message on 9 September, wrote :

nw> Hi!
nw> Is there a free/shareware assembler which supports 68030 code?

There sure is.
Check out the gnu assembler (gcc-as).
Note however that this uses slightly different mnemonics than what is usual
in 68k assembly. (so called MIT syntax).
Basically the difference is that you remove all '.' in an instruction.
("move.w" becomes "movew")
Also it uses "@" instead of () in conjunction with address registers.

like:
move.w d0,(a0)
becomes:
movew d0,a0@

There are lots of sourcecode available in MIT syntax, so this should not be
any problem. Check out ehscsi.tgz on atari.archive for an example...

Also turboass is available. However, I think this one has troubles with the
screen resolutions on TT/Falcon. But for the price, you can afford to check
it out.

I stick with gcc-as.

nw> Which commercial products are available (Price...)?

Devpac TT, and also the Pure-C assembler supports the 68030 from what I
have read about it.

Here's a quick question for you all--

I have a 'stock' Atari 1040ST, 1M, internal floppy, etc. What will happen if I write to the RAM address space above 1M? Will the MMU trap me out as an error?

(What I'm up to is hacking a connector directly onto the 68000 so I can plug in a cable going to a battery backed up SRAM to program on the fly. Kind-of a dedicated EPROM emulator.)

E-mail replys are preferred, but I'll take whatever I can get. :-)

Thanks,
-Clay

See if the drive has a parity jumper on it. If it does, reverse the
setting of the jumper. The Supra interface either doesn't like not
having parity, or
having parity... I don't recall which.

The older Quantum drives-- 40,80 and 120 LP mechs have a parity jumper.
Use
one of those if worse comes to worse. The new ones (EPS, LPS) might
not.

-Clay

(The old ST drive interface is long gone here at Supra, or I'd tell you
more about it...)

4769. Wanted- Audio from my STE!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-09 23:58:47 UTC
From: hallvart@ifi.uio.no
Message-ID: <34qsrn$8hf@baugi.ifi.uio.no>
Source record: 30453

Hi,
Does anyone have a circuit for a driver to a piezo ceramic element, that I can use for my STE?
See, I use an NEC Multisync II monitor that hasn't got a speaker like the Atari's have, and I would like the audio feedbacks still.

I have installed a small amplifier and a speaker inside the unit and that works fine, but I'm thinking about getting an internal hard disk for the machine, and if I do, there won't be spave for a speaker.
That's why I was thinking about one of those piezo ceramic elements, that certainly don't take up much space since they're flat, and could be placed anywhere, like under the keyboard. I know they won't give as good sound as a speaker, but i only need it for the occasional "beep" sounds and warnings.
Anyone got a circuit for anything like that, or can point me in the right direction?
Thanks. Any help will be greatly appreciated!

Hallvard, Oslo, Norway

4771. Software for sale/trade

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-10 04:45:30 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <34rdla$rid@mailer.fsu.edu>
Source record: 30457
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For sale or trade:

Below are a bunch of ST items I want to sell or trade. For buyers, highest reasonable offer gets the item, with preference going to those that buy more than one item. Shipping will be negotiated with the offer.

As for trades, let me know what you have and we may be able to work something out. I am looking for some games (Vroom, Armourgeddon, Prince of Persia, Flight of the Intruder, and many others), Stereotek 3D glasses, working Wico bat handle or Ergo joysticks, European ST magazines (ST Action and ST Review particularly) and probably lots of other stuff. Cash can make up for deficient trade material from either party. Shipping will be negotiated with the trade (though for trades, I often suggest that both parties eat the shipping). Don't be shy, send me some email and let me know what you have to trade.

All of the items below are original commercial products owned by me. Unless otherwise noted, all original boxes, manuals, and disks are included. I have cheats for some of the games, and will include them with the sale/trade.

Please reply via email.

****Application and Utility****

Tempus v1.x, excellent text editor, not as good as Tempus II, but no slouch either. Blazingly fast (hence its name), even on a box-stock 8mHz system. Designed for programming, great for general editing as well.

Neodesk Command Line Interpreter, v. 2.0, adds a command line interface to Neodesk with MSDOS/UNIX style commands. More commands can easily be added (the GNU versions of standard UNIX utilities, for example). This version is really more MSDOS-like than UNIX-like, but the new version 2.1 (to which this can be upgraded) is supposed to be more UNIX-like. There are a couple of neat things about this CLI. First, it pops up in a window on the desktop, so a CLI is only a mouse click (or keyboard macro) away. One can drop batch files onto the CLI icon to execute them, which can be quite handy. Finally, it is quite small, primarily because it reuses the routines in Neodesk to do standard file operations (i.e. when the CLI copies a file, it uses the code already in Neodesk to do it). Only works with Neodesk.

Wordup v3.x, Neocept, with the large thesaurus and large dictionary extra options, plus lots of Genie notes about bug fixes and work-arounds. This is an excellent WYSIWYG word processor, but it does have some bugs. The rights to the code were purchased by Atari (and some of the code used in Atari Works, or so I hear). It is not buggy enough

to be unusable, just irritating at times. This is the final version
that was released.

TurboJet, Neocept, fast GDOS print driver for HP Deskjet and Laserjet printers,
includes a bunch of 150 and 300dpi fonts. Claims to be 200-500%
faster than other HP drivers (for that time, I don't know if there
are faster ones out now).

Microsoft Write for ST, buggy WYSIWYG word processor, the only Microsoft
product ever made for the Atari that I know of, includes a full
copy of Atari GDOS. Can be run from floppies and a ramdisk (Jeez,
did I really do that? I must have been really patient back then :-).
I managed to produce a bunch of papers and letters with it using only
a floppy and color monitor, so it is useful.

Personal Pascal, ICD, I believe this is the final version of this compiler.
The only limitation with it that I know about is that one cannot
pass functions as arguments. Other than that, it is a complete
Pascal compiler environment. The lack of this feature will not
hamper most Pascal programmers, IMHO. Good docs on both Pascal and
the Atari programming environment (it's a big fat softcover book).

CAD 3-D v1.0, Antic, original disk accidently laundered (don't ask :-),
includes original docs plus backup floppy. This is not really for
architectural design (i.e. Dynacadd or Autocad), but to make nifty
3D animations for fun.

****GAMES (Arcade Action)****

Alien Syndrome, overhead view scrolling shoot'em up, lots of fun for two
simultaneous players. Plenty of fast and furious shooting.

Captain Fizz Meets the Blaster-Trons, Psygnosis, sort of like a Gauntlet II
in space, best with two simultaneous players (screen is split to give
each player their own view). Overhead view, destruction galore.

Xevious, Mindscape, port of the stand-up Arcade game Xevious, vertical
scrolling "fly over the landscape shooting and bombing everything"
game.

Ballistix, Psygnosis, Bizzare soccer style game, where one shoots at the
ball to move it around. Really good graphics, so-so gameplay.

Baal, Psygnosis, Excellent platform/adventure game (mostly arcade action).
Future setting, sideways scrolling, large sprites, good guns. This
is a pretty hard game, but lots of fun.

Enduro Racer and Crazy Cars, combo pack, no docs, Enduro Racer is a cross
country motorcycle racing game, Crazy Cars is a racing game. Both
are OK, though quite old.

Super Cycle, Epyx, no docs, oval track motorcycle racing.

Custodian, futuristic platform shoot'em up game, excellent graphics, fast scrolling, lots of weapons, etc.

Eliminator, strange driving/shoot'em up game, lots of different weapons and bad guys.

Frostbyte, Starsoft, side-view platform game, I would recommend it for a small child (in terms of its difficulty). A bit boring for us big children, IMHO.

President Elect 1988 edition, SSI, presidential election simulation, graphics are quite lame (mostly text, in fact), but I suppose a political process fan might like it. It does not appear to be particularly tied to the 1988 elections, and has data for US elections all the way back to 1960. Can apparently be used to predict elections as well.

****Adventures (Graphical Adventures, most with some arcade action)****

Questron II, SSI, RPG, very similar in look/feel to Ultima IV, in terms of graphics and gameplay. Medievil setting.

Bard's Tale, Electronic Arts, yet another RPG, very good. Graphically impressive for its time. Search through buildings, dungeons, and towns (Skara Brae) in 1st person 3-D graphics (small graphics window and restricted movement, but this was many years before anything like Doom was ever seen :-).

Mercenary: Escape from Targ and Second City, early 1st person 3D vector graphics adventures. Future setting.

Gold of the Realm, Magnetic Images, very similar in look/feel to Ultima III, in terms of graphics and gameplay. Medievil setting.

Breach, Omnitrend, classic RPG game, GEM interface mostly, future setting, control a bunch of Marines as they search and shoot stuff.

>E-Mail : ac_green@postoffice.utas.edu.au

Well my e-mail to you came back...!!

But here it is....

Hi Anthony,

Your problem is the Parity on the drive, please disable
parity checking..

I have fitted a New Quantum LPS 240s SCSI II drive to a
30meg Supra box, and I used one here with a Supra host adapter..

New drives come fitted with Terminators, you don't remove them...

You can also replace the Clock chip with a Dallas clock chip,
the one I used has a 10 year battery life, far better that the ones
that were fitted to the Supra host, Supra did fit Dallas clock
chips on there later versions of there host adapter....

Hope this helps.....

P.S. There are some old Supra host adapters that will not work, these are the
one's that don't have the PAL's on the P.C.B....!!!

4773. What's the problem with the Serial Port?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-10 14:02:58 UTC
From: hj7@aixterm4.urz.uni-heidelberg.de
Message-ID: <34seai$6oa@sun0.urz.uni-heidelberg.de>
Source record: 30461

Hi everyone,

after finally having bought a modem for my ST I am getting all kinds of
trouble with the serial port.
According to the Profibuch there seems to be some problem with the RTS/CTS
protocol.
I use TOS 1.4 on a (RAM upgraded) 520 STM with a c't SCSI hard disk interface.
An upgraded Poolfix (POOLF_CB.PRG) and an upgraded TOS 1.4 fix in my AUTO
directory don't fix the problem.

Any help about
- what exactly the problem is (detailed enough to try a hardware fix ?)
- where to find a patch for TOS 1.4 to fix it
would be helpful.
I'd also be glad to RTFM if I only knew where to look for it.

Thanks for any information...

There are a few fixes available at atari.archive.umich.edu in the
directory Tosfixes, I think. You can also try nic.switch.ch under
mirror/atari/Tosfixes. This is a mirror of atari archive, that should be
easier to access from Germany.

From: paul@deluxe.textlitho.nl
Message-ID: <EIKRBCUU22-UP@deluxe.textlitho.nl>
Source record: 30452

Hi,

What could be causing this:
Outline Art 3.0 runs fine in 16 colour mode on my F030, but
does not in 256- and truecolour mode. When importing a CVG
it puts the frames in the window allright, but draws their contents
outside the window, like somewhere behind the interface.
Same thing with Calamus - it just won't do anything right in true colour.
I have a 4mb machine with OUTSIDE virtual RAM, NVDI 2.5 and a Screenblaster.
The problem only seems to occur with DMC programs and changing my boot
setup does not affect it. Anybody?

Thanks,

Paul

I hope someone out there can help me with this: I have acquired a memory board for my STFM, that was previously fitted in another machine. Problem is I got it with no documentation....

Does anyone have the installation instructions for a "Ladbroke Computing International" 2 megabyte memory board? I have naturally tried the manufacturers but they inform me it is an obsolete design and they no longer keep the manuals for this model. That's progress, I suppose.

If you can help, please email me. Thanks.

There is now EGEM 2.00 available at ftp.cs.tu-berlin.de in the /Newitems
directory. This version has complete (german) documentation and a revised
demonstration program. Also, from what I can tell, the check-boxes are
a little different. Also, the help display seems to have change quite
a bit.

>1. What's a PSU? [sorry]

Power Supply Unit ;-)

>2. I'm having similar problems with my Spektrum 1 board. Two problems

Well it does sound like heat. I get slight vertical flicker in colour modes *all the time*. In mono its only parts of the picture, although if you look very carefully the whole picture is moving slightly (horizontally).

What you could try is a cold gas spray (available from electronic stores). This is an aerosol filled with an inert gas which comes out *cold*! All you do is spray each chip in turn with it and see if the problem goes away. If i does, then you know the chip is overheating and you can fit a heatsink.

Disclaimer - never *actually* tried this myself. Went to buy a spray the other day, but it was 8ukp! ($12). I'm trying a new PSU first. Its slightly more expensive (30ukp by the time I've made all the connecting cables), but will prolong the life of the machine, even if it doesn't cure the problem.

Roland.

Cubase Audio is what I wanted. A Falcon with Cubase Audio, SPDIF interface and a
500 meg SCSI disk seems to be the dream system for me. It would give me 16 channels
of 48kHz digital recording in a box of the size of my old ST...Quite amazing.

>Glad to hear somebody has done it! I have a 150W PC PSU on order. Don't
>know if it is an AT or XT one though.

Shouldn't make very much difference, though the 'older' XT power supplies
have slightly different shaped connectors, but both will fit.

>Not entirely sure what you mean here. I know the TT PSU has a single 12
>pin plug, and the PSU I've ordered has two 6 pin plugs. I assumed I was
>going to have to wire a new 12 pin plug up the same way as the existing
>one. Are you saying that two 6 pin plugs end to end have the same wiring
>as the 12 pin one?

When you look at the connectors from the AT power supply you will notice
that both connectors have 2 black leads (the GND wires) you should keep
these side by side like this:

```
--
| o|--- RED
| o|--- RED
| o|--- RED
| o|--- WHITE
| o|--- BLACK --
| o|--- BLACK |
-- >
| o|--- BLACK |
| o|--- BLACK --
| o|--- BLUE
| o|--- YELLOW
| o|--- not connected (at least not with my XT/TT power supply)
| o|--- ORANGE
--
```

I don't know what will happen if you mix-up these two connecters, but I'm
fairly sure disaster will strike...

>Also I notice the TT PSU screws into the motherboard. Is it necessary to
>connect any leads from the PC PSU case to these screw holes in the
>motherboard?

Ypu will need a connection for grounding purposes, if you have an 'older'
TT it will have metal shielding all over, just connect a reasonable thick
wire between the metal of the PSU and the shielding.

>Alternatively can I just get away with wiring up the 12 pin
>motherboard connector and the disk drive power sockets?

Yep, should work OK

>Yes - I've thought about this. I wouldn't have thought the harddisk got
>much air from the PSU fan! However I was thinking of mounting a small fan
>behind the grill on tha back of the TT, where the original PSU fan sat.
>Does this sound sensible?

Yes, with the emphasis on 'sound' :-) you will get 'double' the noise,
except if you put in a quiet fan of course.

The TT-High flicker/jittering is a known problem on several revisions
of the TT mainboard. There exist a flickerpatch for every but a few
revisions of the TT. The latest revision is as good as flickerfree.
Setting the FPU clock down to 16Mhz also helps a little on flicker, so
if you're not using any app's that's depending on FPU speed, that might
do the trick.
The flicker patches does mostly consist of soldering an extra lead under
the PCB close to the TT-High video chip's, or one of the buffers (74xxNNN
chip). I've fixed this problem on a few TT's myself a couple of years
back....
Exact details on the diferent patches should be available direct from
Atari or from repairshops with authorisation.

4787. CWAC's 3.02 Info....

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-12 01:23:14 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <350ai2$o2v@golem.wcc.govt.nz>
Source record: 30466
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

As the CWAC's info file never got posted to A.A. here is some more info...

This is now on A.A. in the Archiver directory...

NOTES:

1.) Never use any LZH program above LZH201L for archiving, nasty changes were made in the way Base Page is set in Christians versions...

2.) Don't ever use the German port of ZOO 2.1...

What is CWAC?

CWAC, pronounced "quack", is Cool Wave Archive Converter. An automation package that assists your conversions of archives, or files into archives. This is all achieved with a simple GEM interface with interlaced help screens to guide you along the way. Conversions can be made from ARC, ARJ, LZH, ZIP, and ZOO, and converted to ARC, LZH, ZIP, or ZOO. You can also convert any groupings of files with a common extension. For example, if you want to take a bunch of *.TXT files and convert them to single archive files, CWAC will do it for you.

For Express or RATSoft owners, conversions also maintain your BBS system files. For Express, it will handle your description files, and for RATSoft, it will handle all of your file area data files. Selection of conferences and file sigs is done with a simple GEM interface. Just click on the areas you want to perform the conversions on and voila. You are also provided the option to enter conversion in standard mode in case you wish to have a path converted without the handling of data files.

CWAC will maintain the date/time stamp of the original archive file if you wish it to do so. This is a very helpful feature, especially for the SysOp of a bulletin board system. Why have all of the files that you convert showing up as new files when it is not necessary?

You can also have up to 5 files included with each converted file, and you can have up to 5 files eliminated from each converted file before it is packed back up. Imagine being able to take out the ads for BBS's that you are tired of seeing!

What follows is the on-going chart of updates and enhancements to CWAC. Only version 3.00 beta will receive public release.

Version 3.01 and above are only released to registered users of CWAC.

CWAC Updates:

Version 3.00beta (3.01)

Added procedure tracking for increased error control, should an error arise.

Added memory checks for users of STZIP 2.2. This program now requires over 512K to be executed, which can pose a problem for users of a 1 meg machine operating a BBS system. CWAC will now issue warnings during setup for low memory, and will indicate possible memory problems if an error occurs during a conversion involving STZIP.

Decreased the amount of memory CWAC uses by about 80K.

Added the option to have files added to or removed from archives during the conversion process.

Added searching, jumping, printing, and page deletion to the log viewer.

Increased overall logging of activities.

Completed handling of command line operation. It is complete, though not available.

Split the resource package in two to allow use of color and hatches in medium resolution, while still maintain readability in high resolution. If it weren't for Hursh, this would have taken longer. Grin.

Optimized the conversion code for the umpteenth time for speed and reduced duplication.

Have put on hold, indefinitely, the addition of optional conversion modules. This would entail more than I care to undertake unless this package becomes successful.

Incorporated digitized sounds.

Added color flow to the title screen.

Added Accessory Access for those requiring this feature.

****
NOTICE

All versions after 3.01 are not available for downloading. The only way to receive them is to register and have it mailed to you through US mail. Each registered version is customized to the person registering.

****

Version 3.02beta

Working date: 7/5/93

Registration amount remains at $10 US ($12 US if you do not supply the disk and self-addressed-stamped-envelope for return mailing of registered version)

Installed option to have date/time stamp of old archive maintained on converted archives. User selectable for each conversion entry.

Added conference/sig selection screens for Express and RATSoft.

Added option to have the log file trimmed in 5K increments from 10000-50000 bytes. This is the result of a user request (I'm sorry, but I forget who it was). You are shown when the trim occurs each time you adjust the log file length. If you have your log size set to 15000 bytes, the trim occurs at 17500 bytes. If you set to 20000 bytes, the trim occurs at 22500 bytes. As you can see, it is hard-wired to trim at 2500 bytes above the size you select. This will allow for reasonable growth between trimmings.

Completed registration kit. At present, no features are disabled on non-registered version because no public release is scheduled. Version 3.02 and above are only scheduled for release to registered users of CWAC.

Fixed a couple of bugs in spacing that appeared in the viewing module for conversion data.

Fixed the bug that caused errors when entering the log viewer after executing a conversion. Stupid bug, but it happens.

Completed BBS Express options: Conversion will convert the archives, rename the description files, overwrite the originals, and maintain the time/date stamp of the originals. You may change these options as you see fit. It was suggested by Terry May to have the time/date stamp maintained so that files would not appear as new in the download listings. Suggestion taken and implemented.

Beginning addition of an 'abort conversions' feature. It was suggested that the user have the option to abort a conversion in process. While I do not feel it necessary to abort a conversion on the current file, it does make sense to be able to abort between files. This will be in before the official release of 3.02.

Delay on the examination of the original documentation for CWAC may cause it to not be immediately included with the release of 3.02. Several features have been updated and included in 3.02 that were not documented in the original documentation.

****

Version 3.02

Scheduled release: 7/23/93

RATSoft module is on temporary hold. Some of the work is complete. Announcements of a new version of RATSoft has put awrench in the works. Not to mention the author must have seen CWAC and is now seeming to include most of the functions of CWAC internally.

Express modules are 100% complete.

Fixed a bug that caused havoc for an afternoon. It was not possible for you to perform conversions on your rebuild directory, yet I was allowing you to set that up as a source directory for conversions. Bug has been found and squirted with Raid.

Updated documentation may or may not be included with the updated version initially. I am working on catching them up, but I really hate doing docs. I try to make the program straight forward enough that they are not really necessary.

Log file operations have been expanded to record the amount of bytes saved or lost during a conversion. This information will also be available during a conversion. The bytes saved or lost on the last conversion will be displayed on the screen for you to see.

The hidden accessory box on the main menu has now been made visible. Clicking on it will give you access to the accessory menu and there is an option to call a file selector, so you can use file selectors like UIS III or LGS to do file operations. These accessory boxes have been there since 3.00, but a couple of the beta testers forced me to make them visible.

****
W A R N I N G !!!!!!!
****

I spend about an hour on the phone with a user who was having consistent errors while running CWAC. It appeared to actually be a CWAC error so I was evaluating the code operations as he was running the program on the other end of the line. At the end of the hour, I finally asked what was in the AUTO folder. Turned out that he was running with TOS 1.06 and had the TOS 1.4 fix and

the Poolfix programs in his AUTO folder. As these programs are
not necessary in TOS 1.06, they caused a MAJOR memory glitch and
resulted in continual bombs when CWAC was running. Please do
yourself a favor and examine what you run in your AUTO folder
before giving up on any program. AUTO folder programs are
usually something that is memory resident from the time it is run
until the time you turn off the computer. Another common culprit
is the accessories that you run. They remain memory resident
also. Anything that remains in memory constantly is capable of
causing major conflicts with other programs.

****
A hearty "Quack" to those who have registered CWAC during this
initial release phase. Please send your request for upgrades to3.02 when you
are ready. An upgrade request is to include your
name, address, phone number, BBS name (if applicable), BBS phone
number (if applicable), a 3.5" formatted floppy (720K please),
and a self-addressed-stamped envelope. If I do not already have
your registration on file, don't send me a request for upgrade,
send me your registration with the shareware fees.

Registration for CWAC is $10 ($12 if you do not wish to supply a
disk and return envelope or if you wish to use a Gift-Of-Time on
GEnie). Please note that you must fill out and fmail me the
registration form if you wish to use the Gift-Of-Time. I will
not mail your registered copy to you until I receive it.

The response has been adequate enough to keep me interested, but
I must admit that some registrations would be nice. To date,
including CWAC 2.04, CWAC has received a grand total of 8
registrations. As I work to enhance CWAC, perhaps the hold-outs
will work to enhance this number.

4788. Where does Filament Voltage come from in SM124 Atari Monochrome Monito

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-12 06:43:30 UTC
From: mwinters@access.digex.net
Message-ID: <350tai$md8@access2.digex.net>
Source record: 30467

I have an old SM124 Atari Monochrome monitor which is not working. My friend determined that the filament voltage is screwed up. Does anyone know where the filament voltage "comes from"? Also, where can I find a schematic of this monitor? That would be helpful to give my friend in tracing the problem. Thanks for any hints.

------ Mike Winters Bring on a mainframe Atari 800!!!

4789. [SOFTWARE] MiNTOS Release 1.4.1 now available.

MiNTOS is now at release 1.4.1

I've just made available via anonymous ftp (from
ftp://earth.ox.ac.uk/pub/mintos) the latest version of MiNTOS, Release
1.4.1. This is a bug fix release which has no more functionality than
Release 1.4.

4790. 17" monitor for a TT?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-12 08:58:23 UTC
From: clausb@hpbbrd.bbn.hp.com
Message-ID: <Cw0E9B.LK9@hpbbrd.bbn.hp.com>
Source record: 30481

Net.folks,

I am thinking about buying a 17" IDEK monitor for a PC. While the monitor is said to be good and all, I'm not sure whether it is possible to hook it up to a TT to produce high-res output (1280x960 monochrome). The monitor should be able to support this bandwidth since it even can display a 1600x1200 resolution on a PC, and it can display 1280x1024 at about 75 Hz.

The monitor has VGA/BNC input, and I think I remember vaguely that the TT's high-resolution output is a somehow strange one which might be incompatible with everything else. Has someone else out there in net.land tried something like this? Any experiences?

Thanks a lot,

Claus

FOR SALE:

Atari 1040STF: Comes with built in Ports for Monitor, Printer, Modem, Hard Drive, External 3.5" Floppy Port, MIDI In and Out Ports, Cartridge Port plus Mouse and Joystick Ports. 1040STF has built in 3.5" Double Sided/Double Density 720K Floppy Drive. Built in drive reads 720K IBM disks. Computer has 10 Special Function Keys. Built in Numeric KeyPad. 94 Key Keyboard. Standard 1 MegaByte of Memory (RAM). Power Supply built-in, comes with Power Cable. Also comes with 2 Button Mouse for interfacing with GEM, (Graphics Enviromental Manager).

1040STF Computer Sells for $125!

Atari SC1224: Color Monitor has LED Power light on front. Has 3 Knobs on side: Brightness, Contrast and On/Volume Knob. Has Monitor Cable with 13 Pin Male Plug. Power Supply Built-in. Comes with Power Cable. Has 5 Video fine tune adjustments in back: V. Lin, V. Size, V. Hold, H. Position and H. Hold. Does both 40x25 and 80x25 Text. Does 320x200x16 Colors and 640x200x4 Colors. Does both InterLaced and NonInterLaced Graphics. Does both 50HZ and 60HZ refresh rate. Works great with Atari ST's, including 1040STF's.

SC1224 Color Monitor Sells for $125!

Your Choice, either the 1040STF or the SC1224 for $125!

I had a 520 STFM once. The diskdrive stopped working and I bought
a pc 1.44 mb drive, and replaced it with the old one. The drive
did work indeed but some games and some demos didnt work.
I suspect it has something to do with the number of tracks or
load routines.

The drive was external.

Hope this helps

4794. ar for MiNT

Newsgroup: comp.sys.atari.st.tech

There's one problem. I thought about this too, but the ET4000 chip
already has an enormous heatsink on it... So I suppose I'd rather
be going for a tower unit with a tremendous power supply and a
19'' fan or sth.

So... there are still two ways left of plugging them in, aren't
there? Up side up and up side down. Or is one of the two impossible?

why not! my orig 520st upgraded this way (on the day i got the machine from the store) still sits next to my TT (and is working just fine!). here are gerts (revised) instructions:

NOTE: This is an REVISED,TESTED version of the original text downloaded from CompuServe. December 6, 1985

(This was REVISED AND TESTED by an annonymous engineer on Atari's developement staff. The addition of the resistors should provide a long life to your machine, but the warning below is STILL IN EFFECT. This is not an official sanction of the modification. USE WITH CARE!!!)

Here's the 1 Meg upgrade directions:

I have brought this over un-editted from the arpanet info-st mailing list. I TAKE NO RESPONSIBILITY FOR ITS CONTENT OR ACCURACY. I HAVE NOT TRIED THIS MODIFICATION ON MY OWN ST AS YET. I AM PASSING THIS ALONG TO THOSE WHO DO WISH TO TRY IT. FOLLOW THE DIRECTIONS AT YOUR OWN RISK.
--Dwight McKay (75776,1521)

From: gert@pescadero

WARNING: This is a hardware modification that will void the warranty of your 520ST. If you do not have the appropriate tools or experience you have a substantial chance of ruining your 520ST. Proceed at your own risk! This modification has been in my 520ST without any problems for 6 days now. However, I have (of course) not checked with knowledgable sources at Atari to verify if this modification endangers the long term machine reliability and/or software compatibility (I suspect it may endanger their software compatibility if enough of us do it!)

Tools & components needed :

16 256k * 1 RAM chips, 150 ns access time type, e. g. NEC 41256C-15 (avilable at e. g. Fry's Electronics, Sunnyvale, CA for $2.77 each)

A good quality, preferrably temperature controlled soldering iron, with a minature tip (tip should be narrow enough to avoid touching 2 I. C. pins at the same time). E. g. Weller type soldering station.

Good quality resin core solder (thin).

Approximately 4 foot of #24 AWG insulated wire and a good stripper for it and 2 feet of #22 AWG solid tinned copper bus wire. You will have to route 3 wires over a sequence if I.C. pins.

Desoldering wick and solder suction tool.

Philips type screwdriver (for opening your ST), tweezers, pliers, etc.

A steady hand and self-confidence.

Explaination of the modification :

(Please read the rest of this document before starting. It may save you time and an 520ST)

The current memory inside the 530ST consists of 16 256K*1 RAM chips. Address (A0..A8) lines are common to all those chips. The WriteEnable line is also common to all chips. Data (in and out) lines are of course individual. The RAS (row-address strobe) line is common to all chips. The 8 chis foring the high order byte group have one common CAS line, and the 8 forming the low order byte group have one common CAS line (CAS is used as enable for write operations, such that WriteEnable can be common to both groups). The high order group from MSB to LSB consists of U45, 44, 43, 42, 38, 34, 33, 32. The low order group of U30, 29, 28, 25, 24, 28, 27, 26. Note that all chips are adjacent, though the numbering has gaps. RAS0, CAS0H, and CAS0L are supplied from U1 pin 8,6 and 7 respectively (The 0 indicates bank 0)

Bank 1 that you are going to build in will be "piggy-backed" on top of the current chips, where all pins of the new chips EXCEPT RAS (pin 4) and CAS (pin 15) are soldered to the old chips equivalent pins. Thus they will end up sharing addresses, data, WriteEnable and power and ground with the existing chips.

All RAS pis of the new chips are wired together and will be supplied with the "RAS1" signal generated on pin 18 of U15 (the memory controller, marked 3H-2119C or so). The CAS pins of the 8 new high order byte chips (on top of U45..U32) are wired together and supplied from the "CAS1H" signal

generated on pin 22 of U15. Analogously, the CAS pins of the new U30 to U16 are wired together and supplied with "CAS1L" from pin 21 of U15.

How to go about it:

Step 1: Open up your 520ST, pull off the keyboard connector and remove the main circuit card from its top and bottom shielding. Make sure to remember which screws go where and note the keyboard connector orientation.

Step 2: Desolder all of the capacitors adjacent to the existing RAM chips. (DO NOT SKIP THIS STEP. You'll lose time if you do, and worse, the modification will no be reliable since you can't solder pins obstructed by the capacitors reliably (if at all)). To desolder them, I found it easiest to heat the island on the non component side, and bend the wires straight. After doing that or each capacitor, turn over to the component side and heat the islands wile pulling the capacitor out with the tweezers.

Step 3: Open up the holes of all the desoldered capacitors, using a combiation of de-soldering wick and suction tool. Do this from the non component side. If certain holes are difficult to open up, you may want to use a wood splinter. (push it through while heating). Be carefull to remove all solder debris!! THE REASON for opening the holes NOW is that they will be less accessible once you've done the other steps! Patience is a virtue.

(NOTE: Step 2 & 3 are the only ones that may damage your ST PC board. Be sure not to use excessive force while pullling out the capacitors. If you damage your PC board anyway, cure the problem now and not later).

Step 4: In this step we will piggyback the new RAM's on top of the old oes. Be sure to connect all pins except pin 4 (RAS) and 15 (CAS). The best way to go about this is to do chip by chip. First, bend the pins of the new RAM's suchthat hey are perpendicular to the package (instead of having slightly spread "cowboy legs"). Use pliers to bend pin 4 and 15 such that the legs are 180 degrees from their normal position, so they stick up in the air above the plane of the top surface of the chips. Don't make an absolute sharp 180 degree bend since some manufacturers' pins may snap off. Leave a little curve in the leg, but insure that is above the plane of the top surface of the chip.

Using #22 AWG to #16 AWG tinned solid copper wire you will form three buses along the top surface of the new d-rams. Cut a #22 AWG solid copper wire the length of the 16 d-rams on the PCB. The RAS bus is formed by soldering all the pin

4's of the new d-rams to the solid copper wire. The bus wire must be seated against the top surface of the new d-rams without a gap. This insures clearance between the top shield and the pins of the d-rams.

After soldering all 16 d-rams to the bus clip off any portion of the pins that extend above the top of the bus wire. Now cut a #22 AWG solid copper wire the length of the 16 d-rams. Place the bus wire along the top surface of the new d-rams in contact with all the pin 15's of the new d-rams. Solder every pin 15 to this bus and as above insure that the wire is seated solidly against the top surface of the new d-rams. Cut off all excess pin length sticking up above the top of the bus wire. Using diagonal cutters remove the section of the bus connecting the new U30 pin 15 to the new U32 pin 15. This divides the bus in half with the new U16, 17, 18, 24, 28, 29 having a common pin 15. The new U32, 33, 34, 38, 42, 43, 44, 45 now have a common pin 15, seperated from the other common bus.

(NOTE: until step 6 is finished, do no in any way apply power to your ST. This intermediate state of affairs will damage your memory chips!!)

Step 5: Remount all the desoldered capacitors. Bend the pins like they were before resoldering, suchthat they will not touch the lower shielding. Solder from the non component side.

Step 6: Orient the 520ST PCB so that you are looking at the solder side of the PCB (non-component side), with the row of d-rams nearest you. Find the double square pattern of pads at the 68-pin socket of the memory controller, U15 (3H2119). The following is a guide to locating the six memory controller pins necessary to complete the wiring. The socket is numbered conterclockwise, starting with pin 1, the square pad (look closely) in the middle of the bottom outside row. The sequence, moving counterclockwise from pin 1, first on the outside square ONLY: (NOTE: the sequence ")(" means to make a 90-degree turn counterclockwise, i.e. around the corner)

1,3,5,7,9)(10,12,14,16,18,20,22,24,26)(27,29,31,33,35,37,39,41,43)(44,46,48,50,52,54,56,58,60)(61,63,65,67

The sequence, moving counterclockwise along the inside square only, and starting with the left side of the bottom row:

(62,64,66,68,2,4,6,8)(11,13,15,17,19,21,23,25)(28,30,32,34,36,38,40,42)(45,47,49,51,53,55,57,59)

Six 68-ohm 1/4W plus/minus 10% carbon film resistors must be added when adding memory. These series terminating resistors minimize undershoot which may damage BOTH BANKS of d-rams if omitted. Solder a 68-ohm resistor to pin 18 of U15, RAS1. Solder a #24 AWG stranded wire from the remaining end of the 68-ohm resistor to the pin 4 bus (RAS) of all the new d-rams. that is the new U16, 17, 18, 24, 25, 28, 29, 30, 32, 33, 34, 38, 42, 43, 44, and 45.

Solder a 68-ohm resistor to pin 22 of U15, CASH1. Solder a #24 AWG stranded wire from the remaining end of the 68-ohm resistor to pin 15 bus (CAS) of the new U45,44,43,42,38,34,33,32.

Solder a 68-ohm resistor to pin 21 of U15, CASIL. Solder a #24 AWG stranded wire from the remaining end of the 68-ohm resistor to pin 15 bus (CAS) of the new U30, 29,28,25,24,18,17,16.

For best results in all three cases above solder the wires coming from the resistors to the middle of the three bus wires in a "T" fashion rather than at one end of the buses.

Use a continuity tester to find the following three traces -- do not depend on visual inspection. Now install three 68-ohm series terminating resistors in the original 512K bank of ram. Be very careful while soldering to these narrow traces, since excessive heat can easily lift a trace from the board. Use an Exacto knife to gently remove solder mask from traces.

Cut the trace leading from pin 8, RAS0, of U15 near U15. Solder a 68-ohm resistor in series with the trace.

Cut the trace leading from pin 6, CAS0H, of U15 near U15. Solder a 68-ohm resistor in series with the trace.

Cut the trace leading from pin 7, CAS0L, of U15 near U15. Solder a 68-ohm resistor in series with the trace.

Step 7: Sit back. Use Brain. Do you feel confident about the quality of your work? No mistakes? Check evrything once again if you are but a little uncertain. Applying power with errors might make your ST into a decorative, nonfunctional piece of art. OK. Either rebuild your ST into its shielding and cabinet, or put it onto a surface clear of wires and solder remians and connect it to monitor, disk and supply. Boot it.

It it boots, you're probably there. Test if the new memory works by looking at the phystop variable ($42E) with SID if you have the developer stuff. It should read $100000 (1M hex). Also note that memcntlr ($424) now holds 5 instead of 4, and that v_bas_ad ($44E) now holds $F80000 (screen bitmap

origin). If you don't have the developer stuff, try a single drive copy and check that you get the whole disk in one buffer instead of two.

If the new memory does not seem to exist, use SID to deposit and retrieve words on locations $80000 and up (1/2 Meg hex). If bit errors occur, the ST bootROM did not detect the extension (it checks all bits of 512 locations by testing a psedo random sequence, before accepting a memory bank). Try to pin point the faulty chip(s) and remove the error.

If it doesn't boot, you're in trouble. I'm sorry. It is difficult to give hints on what to do here. So many possibilities. Desoldering the new chips probably won't work (if the old ones were functional, the ST would still boot). Check for hidden short:circuit on the RAM pins. May also be that you have a flaky new pin connection.

That's all there is...

You connected a CD or something like that directly to the input....
The solution I found to be working is to remove the amplifing chip as
described in Cubase Audio's manual. After that you will have flat input
and output.

4800. Atari Ghostscript 3.01 Beta Release Available

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-12 23:15:25 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <Cw3r3G.Fxv@world.std.com>
Source record: 30400
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.announce

Hi,

A beta release of Aladdin Ghostscript 3.01 is now available from

ftp://lifshitz.ph.utexas.edu/pub/atari/ghostscript/gs301bt1.zoo.

The code in this archive is a 68000 executable, and has all of the PostScript support files and three fonts (Courier, Times-Roman, Charter-Italic) compiled into the code. This reduces the baggage that accompanies GS, but it makes the executable rather large (~800K). Also included in the archive are a bunch of files to support the new on-line help features.

The extensive changes in the Atari interface are certain to have introduced bugs, so please expect them. When enough kind people have made useful bug reports and most problems appear to be fixed, I plan to make available several versions with various levels of hardware support. There will probably also be versions without the start-up files compiled into the executable.

The Atari interface has changed a good deal since GS 2.61. Look at http://godel.ph.utexas.edu/Members/timg/gs/gs.html if you want an overview of what has changed before you download anything.

>friend determined that the filament voltage is screwed up. Does anyone
>know where the filament voltage "comes from"? Also, where can I find
>a schematic of this monitor? That would be helpful to give my friend in
>tracing the problem. Thanks for any hints.

The filament is coming straight from the power supply (usually via a
current limiting resistor) or from a tap of the line output transformer
(depending on revision number) In the latter case the filament won't glow
until the line output transformer 'runs' properly (read: monitor connected
to the computer and both switched on) If the line output transformer is
working properly (screen becomes static) then indeed there must be a fault
in the filament circuit (check this circuit also for a current limiting
resistor) otherwise it could be the line output transformer has an internal
short (a common fault) and has to be replaced (= expensive).

Good luck (and don't touch the 'live' parts when switched on, please)
Gert

Source record: 30477

>When you look at the connectors from the AT power supply you will notice
>that both connectors have 2 black leads (the GND wires) you should keep

Yep my TT looks like your diagram. I see what you mean about keeping the
black wires together.

BTW I had a look in a PC today (Olivetti M4-422S). The PSU arrangement was
very similar, but the pin out connections on the motherboard connector were
slightly different. I suppose I'll just have to check *very* carefully
before I plug anything in ;-)

>I don't know what will happen if you mix-up these two connecters, but I'm
>fairly sure disaster will strike...

An expensive smell, I expect! ;-)

>Ypu will need a connection for grounding purposes, if you have an 'older'

I have a newer TT with the red ferric paint.

>>Alternatively can I just get away with wiring up the 12 pin
>>motherboard connector and the disk drive power sockets?
>
>Yep, should work OK

So no need to connect the new PSU case to anything? Sorry to keep asking
this, but I'm getting very mixed responses from people.

>Yes, with the emphasis on 'sound' :-) you will get 'double' the noise,

Well I can live with that (probably)!

:-)

Thanks

Roland.

>(and where I might obtain one (prefer Australian but others OK too)) that
>work well, have a clock on board and extra SCSI ports? I am prepared to buy
>a new host adaptor if this is necessary.

It could well be that Supra adaptors don't work with SCSI 2 drives - but
I'm not sure. The ICD ADSCSI+ *does* work, as I have a Seagate ST1280N
(which is *supposed* to be a SCSI 2 drive) plugged into one.

> And just to increase my SCSI knowledge a bit. Does anyone know how
>compatible SCSI 2 devices are with SCSI devices, what are the main

SCSI 2 is an extension of SCSI. However SCSI 2 drives should work with SCSI
controllers and SCSI drives should work with SCSI 2 controllers. If you
have both a SCSI 2 drive *and* controller then you might get some extra
benefits as well.

>differences and what on earth do terminating resistors do?

Terminating resistors are needed to stop the SCSI signal echoing(bouncing?)
up and down the cable. There are some simple rules which I can't remeber
at the moment. Actually I've found I can ignore termination, and everything
seems to work okay anyway.

IMO its you Supra host adaptor thats causing problems. I bought my ST1280N
along with a few other people. I'm pretty sure one of them had trouble
getting it to work with his Supra adaptor. It might be the capacity of the
drive as opposed to its interface though.

Roland.

It's in the binutils package. Look for something like utilXX.zoo or
butilXX.zoo.

It have been in the same archive your linker, `ld', or `gcc-ld', had
been in. Maybe you have it already, but it's called `gcc-ar' or
something like that?

Thanks much. I'll stick this in an lzh file and file it on atari.archive
for future reference, if you don't mind.

I think I have managed to design my own SIMM upgrade, borrowing very
heavily from an existing memory upgrade instruction set currently on a.a.u.e.
If I get it to work, I'll put my instructions there as well. Actually, given
that all goes as planned, I'm amazed that it is this easy (famous last words).
I've also learned a bit about how modern memory works while researching this
project.

Hey, I have been seeing ads for a new Intel upgrade chip that replaces any
286 with a 486. It appears to be a chip-for-chip deal (obviously, the
rest of the machine will be AT grade, so it still won't be a screaming speed
demon). Anyway, I was curious if y'all had tried on of these things on your
286 based emulator? It is supposed to be plug-and-play on PCs, and
software can supposedly detect that a 486 has been installed automatically.

4807. Falcon Audio Ports

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-13 02:24:08 UTC
From: tdcflcn@infinet.com
Message-ID: <3532g8$pb8@rigel.infinet.com>
Source record: 30480

A short while ago, about a week, there was a post here that read
something like:

"What is the Impedence of the audio ports?"

One of the responses that I read said:

"Input is intended for microphones, so if you want to do line-level
stuff, you have to add 2 200k resistors (one for each channel), and also
add a 1uF condensator in order to remove the 9V phantom power."

I'm not an electonics person but what is a "condensator". The people at
Radio Shack looked at me stupid, (which is not unusual), when I asked for
a 1 uF "condensator".

Also do I need 2 of them? (one for each channel)

Will this get rid of the hum when I try to hook it up to my stereo?

I get this hum both ways, 1/8 jack to RCA splitter to inputs on stereo
and Line-Out from stereo to 1/8 jack on Falcon.

Thanks for any help.

4808. IDE Host Adaptor

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-13 10:30:52 UTC
From: diehl@bonk.io.org
Message-ID: <353v0s$jji@ionews.io.org>
Source record: 30487

Greetings,

I'd like any information anyone can give me on the IDE Host adapter for the Atari that I've been hearing about. (i.e. how much, where does it plug in to, where to get one, et cetera) A number of people in my area -- myself included -- are eventually hoping to either switch to an IDE setup, or get a new setup as IDE (I'm of the former group) and any information would be greatly appreciated.

I believe the correct English word for it is `capacitor'. The `u'
stands for `micro', as the `mu' cannot be typed. I'm not sure but I
guess you would need two capacitors, in series with the resistors.
Don't take my word, though.

Good luck,

4810. Problem with Mega ST4 floppy

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-13 12:16:56 UTC
From: urbansky@bailey.com
Message-ID: <Cw2I48.F4K@bailey.com>
Source record: 30489

I am having some serious problems with my Mega ST4 floppy drive. It has recently been replaced with an IBM-style 1.44 meg drive, though no other changes have been made as far as I know (I bought the unit after this had been done). Basically, I have the floppy drive disconnected, for when it is connected the Mega resets randomly. It's a pain to be in the middle of a sequence and BAM -- it's all gone.

Does anyone know what could be causing this? Would a 720K floppy fix the problem (if I could fine one)?

I also have a Moniterm monitor that I would _love_ to get rid of, as none of the MIDI software I have runs on the beast, and I don't know of any universal ed/libs that do. I would like $250 for it and the card for the Mega, or I would like to trade for an SM124 and either some cash or some cool MIDI hardware/software (a MIDI patchbay would be nice!)

Hard & Soft have (had?) a converter box available which converts the signal
to ECL which the TT needs to produce the 1280x960x1 rez. I couldn't find any
reference to it in the latest ads, but I recall that it needed a monitor
which could keep up a certain frequency. Call them on 02305/18014 and ask!

4815. 512/4096 colours

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-13 17:09:29 UTC
From: gmg1003@hermes.cam.ac.uk
Message-ID: <gmg1003.4.001128F7@hermes.cam.ac.uk>
Source record: 30393

Please can someone help me. I am writing a program in assembly and would like to show a full set of colours on the screen at once, Could some kind soul show me something suitable for displaying Spectrum 512 still pictures and/or a routine which would allow me to do ather things at the same time (i.e move sprites over the top of it - as seen in many games).

Condensator sounds like bad english for the archaic term condenser
thus the phrase should read

1 micro Farad capacitor

Uhmm, that should probably have been gcc-ar.ttp (if you are using gcc).
Anyway, it is the program the creates a library out of a bunch of object
files. gcc-ar should be located in the same archive as gcc-ld and friends
(probably binutils.zoo).

tF> a 1 uF "condensator".

Ahh, uhmm mixed up all those languages again, sorry. It was me that wrote
that, and in English, condensator should have been CAPACITOR.
Although I'm a bit surpriced that they didn't get the point if you showed
them in writing "1 uF".
uF is short for micro-farad. The 'u' should really be the greek letter mu.
Just explain to the guy you buy it from that you need a capacitor for
removing 9V static voltage from an audio signal, and he should be able to
help you getting the kind of capacitor you need.

tF> Also do I need 2 of them? (one for each channel)

Yup.

tF> Will this get rid of the hum when I try to hook it up to my stereo?

It might, however if you have a loud "hum", this is probably because your
equipment is badly grounded. Or you have a fault in one of your cables.

Anyway, I would strongly advice you to do this modification anyway. You
might hurt the device you connect to the input with the 9v signal.

tF> I get this hum both ways, 1/8 jack to RCA splitter to inputs on stereo

4821. Problem: MinixFs, ICD and BGM partitions > 64Mb

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-14 06:37:29 UTC
From: woodford@esca.com
Message-ID: <1994Sep14.063729.22445@esca.com>
Source record: 30401

Hello world,

Well, since Stephen Henson is either on vacation or something since he's
not checking his emailbox, I'm throwing this to the net.
This is a copy of the message I sent him re. my current problems with
MinixFs:

----------+----------

System: Atari ST, 16MHz ICD AdSpeed CPU, 4Mb RAM, ICD AdSCSI+ host adaptor,
TOS 1.4, ICDBOOT v6.2.3, MiNT v1.09, MinixFs 6.10, Maxtor 7080S HD
partitioned as follows:
Drive Size ID OS
C: 12Mb GEM TOS
D: 6Mb GEM TOS
E: 64Mb BGM Minix V1, 1024 bytes per sector.

The system has been working perfectly with the above setup for a while now.
All sources have been compiled using Gnu gcc v2.5.8, and the latest version
of MintLibs.

A couple of days ago I bought a 1Gb Seagate ST11200N drive. :-)
I understand the limitations of the ICD software and BGM partitions, so
I partitioned the drive as follows:
Drive Size ID OS
F: 32Mb GEM TOS
G: 64Mb BGM MinixFs V2, 1024 bytes per sector.
H: ~430Mb BGM MinixFs V2, 8192 bytes per sector.
I: ~470Mb BGM MinixFs V2, 8192 bytes per sector.
J: 32Mb GEM TOS

(I've actually tried various combinations, with the same problem...)
Everything works great until I run minit.ttp to write the minix file
structures. (ie. minit -V -n 2 -P x:) Copying to/from all the new
partitions _before_ running minit, (ie. under TOS) everything works
great. No errors of any kind, no corruptions etc.

Run minit on G: with no problems and things still look fine (G: is the
64Mb BGM partition with 1024 bytes per sector, remember). However,
run minit on the other HUGE partitions where sector size is 8192 bytes
and problems start. The first parition, H:, seems to go ok. minit will
sometimes crash on I: however, with an endless loop of error messages
from Mint about process 'minit' (Address Error, and Bus Error). The loop
will eventually terminate with a fatal mint error. Other times, I: will
appear to complete successfully. However, any subsequent access on I: or
H: (such as "df") will again crash mint.

I reckon there is a problem with the sector size when accessing these big partitions. Trouble is, minit -t indicates that although XHDI isn't being used, physical accesses with lrecno are... <boggle>

I've already done a quick walkthrough of the code in hdio.c without finding any obvious problem. In the next few days I'll dig deeper in an attempt to track this thing down.

Now obviously, if you're aware of this problem you could save me the bother! If you're not aware of it, expect a full report in the near (?) future and hopefully a fix from me. I don't intend to sit back and relax until I get this 1Gb drive working with MinixFs. It cost enough......

----------+----------

Anyone else got minixfs running with the ICD driver and > 64Mb partitions?

Cheers, Steve

Hello,

I recently bought a digital 500Mb hard disk for my TT. When the drive is
connected I loose 4-5Mb TT-RAM space. This is not dependend on the
partition scheme.

When I disconnect the new 500Mb drive and leave the 240Mb drive installed,
I stil have 9.5 Mb out of 10Mb free. With the 500Mb drive, it decreases
to around 5Mb free out of 10Mb. This is absurd.

I am using AHDI601 which has not give me any problems so far...

Can anyone shine some light on this problem and how to solve it?

Marcel.

Hi all!

When I turn on my ST the picture sometimes is "shifted" to the left. I turn it off and on a couple of times and then the picture is OK in the middle of the screen.

It does work in 640x400 either shifted or not, but when I use Overscan at 752x480 the picture flickers in horizontal stripes like there is some sync problem, all this happens when the bootup screen is shifted to the left.

Is it the shifter? Or my home made auto overscan mod? I use 74LS157 to switch freq for overscan.

Any help greatly apreciated!

Greets from

Jan Sjoberg, Sweden

I was doing some testing regarding memory fragmentation,
and found that STZIP26 can have a problem..

If you load STZIP26, and then change your mind, and click
on the cancel button, in the file selector, the memory
used is not cleared...

If you click on a dummy Zip file then click on the exit
button, all is OK..!!!

Is Vincent still supporting this program..??

I will try and report this bug with him..

>Hallvard, Oslo, Norway

Maybe far more reliable and of better sound quality would be a pair of
Labtec speakers, like the ones ones on PC (Soundblaster) and personal
stereo's.

You will need a mini-din to RCA adapter, but those can be had for
under five bucks.

I will be using a Multisync also (soon as I get the cable and build my
converter) and my solution will be the Labtec speakers. They're
pretty cheap, AND you can have stereo sound for games which support
stereo.

HELP !!!!

I try to format a Quantum 425i S SCSI disk in my MEGA STE but HDX
just won't :-(("check your connection and try again")

FHDX will format it, but only makes 4 partisions og max 32 Mbyte
(and that's only 128 MB of the whole 425 Mbyte !!!)
Supra harddisk formatter has more partisions but each is max 16 Mbyte

And if I try to repartision the disk with HDX after formatting with
FHDX or Supra I only get a "error in boot-sector - reformat disk" !

Everything works great on a TT - but I don't have a TT....

Does anyone know what to do (anyone from Atari out there ?)

I never heard about limitations of the ICD software with BGM partitions.
But I know this braindead software still produces non AHDI compatible
extended partitions by default. This *may* cause your problems.

> Drive Size ID OS
> F: 32Mb GEM TOS
> G: 64Mb BGM MinixFs V2, 1024 bytes per sector.
> H: ~430Mb BGM MinixFs V2, 8192 bytes per sector.
> I: ~470Mb BGM MinixFs V2, 8192 bytes per sector.

MinixFS-Partitions aren't as silly as GEMDOS partitions wasting 16 KB
for a one byte file. You always have a fixed sector size (1024 bytes
as I remember).

> Run minit on G: with no problems and things still look fine (G: is the
> 64Mb BGM partition with 1024 bytes per sector, remember). However,

This seems to be the problem I mentioned above. F, G and H are AHDI
compatible, but I and J are not. Try to convert the J: partition into a
MinixFS partition and you'll see if I'm right.

> I reckon there is a problem with the sector size when accessing these big

4830. AT/IDE interface for the Atari ST

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-14 18:55:00 UTC
From: samuel.arvidsson@p13.secom.ct.se
Message-ID: <2e77556d@ct.se>
Source record: 30414

All the information is obtained from Chara' Data AB in Sweden.

The adapter is a little circuit board that fits on the CPU and it has a
socket where you can fit TOS 2.06 ROM's (which works on the ST!).
It handles 2 IDE HD's.
You can have an internal 2.5" HD or an external 3.5" HD (internal in the
Mega ST). The adaptor works fine even if you already have an HD in the DMA
port. Included in the package is SCSI Tools Jr 4.xx which handles ACSI,SCSI
and AT/IDE drives. The adaptor can be used in a ST or a Mega ST. It does
not work on STE.

Here is the prices (in SEK):
AT-BUS 2.06 card 995:-
Mounting-kit Mega ST 3.5" 295:-
Cable for internal 2.5" HD 195:-
Cable for 3.5" HD 179:-
TOS 2.06 ROMkit (swedish ones!) 695:-

About 7.2 SEK is 1US$ and about 11 SEK is 1 pound..

Define "didn't fit". Is the card just a bit too big to fit into the laptop's ISA bus? Is there no ISA bus (these are somewhat unusual to find in a laptop)? I have had to file some excess plastic from PC cards on several occasions to get them to fit properly, though this was with some rather old PCs. In one case, I had to do this with 20 Ethernet cards whose edge connectors were just a bit too wide to fit into Zenith card slots (I suspect the Zenith parts were undersized, damn proprietary PC junk...). Obviously, if you have to hit a trace with the file, there is something wrong that is more basic. :-)

Actually, I spent a bit of time looking for a PC laptop that had at least two ISA card slots (one for GEMulator, one for Ethernet) and could not find one. If your friend does have an ISA bus in his machine, I would be interested in knowing what the manufacturer/model/cpu-type is.

4832. Slip over MintNet

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-15 03:13:01 UTC
From: David L Watson <dw4g+@andrew.cmu.edu>
Message-ID: <8iRvixC00WB78c3Zpn@andrew.cmu.edu>
Source record: 30411

I'm trying to run slip using MintNet and I've run into some problems (big surprise!). I've run the test in the FAQ using udpprobe, and Mint-Net seems to be working fine.
When I run /etc/slattach -t /dev/ttyb -r hostname, it tells me:

ioctl (SIOCSIFLINK): invalid function number.
connot get interface name

I'm never quite sure that I still have my connection over the serial line. (BTW I basically have a straight serial connection to the network, no modem.) What can I use to basically just send stuff to and from the modem2 port, from within MiNT? All I need to do is send a few carriage returns and "slip" and make sure that it's getting received. The other possiblity that I have considered is that something is wrong with what I'm typing in as the hostname. I've tried using the straight IP address of the host I'm connected to, but it gives me the same error.
Also, what do I need to do to set up the speed of the port? I've tried to set /dev/ttyb to be 38400 (using stty), but it won't let me do it. It works when I do 19200. (/dev/modem2 has been renamed to /dev/ttyb, so that shouldn't be a problem).

Thanks,
David

MB> the partition scheme.

What HD driver do you use? I suspect that it uses a lot of space for this HD because the cluster size or someting like that is to big.

Try to boot with just AHDI for a change and dump all caching software. It's likely to be something like this.

Otherwise try ICD, which is much better :-)

You could give my BBS a call if you don't get it going. We _are_ in the sma ecountry. I have had a lot of experience with HD's (sysop do ya know :-)

As far as I know big partitions require an XHDI compatible driver. The ICD
software is not XHDI compliant. But maybe we should wait for Stephen to
solve this.

There is at least one limitation: The ICD software can't boot from BGM
partitions, other drivers can. Drivers that are compatible to AHDI 3.0 must
be able to boot from these partitions.

4838. Help needed with fixing dead ST's

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-15 08:25:03 UTC
From: jamie@spuddy.uucp
Message-ID: <1994Sep15.082503.11171@spuddy.uucp>
Source record: 30409

Greetings...

I have a number of "dead" 520 & 1040 ST's that really need restoring to life. If you have any experience with dealing with these machines specifically I would greatly appreciate any advice or common problems that you have noticed, before I waste hours on each one.

Many thanks in advance.

Jamie

Ludo says: it can be that the drive needs parity setting using software.
There are drives on the market that do not have dip switches to do this,
and only let software do the setting. There are now a couple of controllers
who are capable of this, fe. (i thought) the new LINK (SCSI2) from ICD. If
the parity is not correctly set, the drive will not function correctly on
a controller who does not support this. I thought the newer (270 Q) had this
problem also, but (as I am having a slight headache (staying up TOO late))
I am not certain of that. What your friend said about terminating resistors
could be the parity software settings.

I could be wrong, I could be right...
(try to format it on another ST or falcon, and maybe your drive will then
correctly work.. An Amiga format is not compatible with the ATARI standard,
so that wouldn't realy make waves. Give it a try, it's the cheapest sollution.
But then again, it might not work..

Good luck!
Ludo

Ludo says: depends on the version of Calamus you have. The good old 1.09
works only in high res, and only the newer versions of S(L) work on the
Falcon with a patch to work correctly when started in colour resolutions.
With patch it works correctly in high color modes, because the color handling
of the Falcon differs from other ATARI machines.
Without the patch you get the scrambled screen output (and everything that
is supposed to be black is grey, and all is drawn into a very small area etc)

Well, I'm the original poster with the problem. I've downloaded at least
two versions of ahdi from umich. For some reason, HDX _will not_ format
either of my disks! When I select the format option, hdx sits there
for about 10 seconds, then accesses ACSI-0 for a few seconds, then ACSI-1
then ACSI-2. I then get a window where I'm supposed to select the drive
I wish to format. Trouble is, _none_ of the ACSI devices are listed! All
I get is a list of 8 SCSI devices and 1 IDE device, none of which are
"responding"! Remember, this is an ST, not a Falcon. However, if I select
the Partition option of hdx, I _do_ get the correct ACSI devices listed.
But, since they were previously formatted by ICD, hdx tells me to reformat
them to AHDI standard. I've even tried using ICDFMT to partition them to
be AHDI compliant, still with no luck.

On top of all that, the ahdi driver doesn't install an XHDI cookie, so
I'm still not able to use huge BGM partitions! (Presumably because
the drives haven't been HDX formatted yet.) <sigh>

As for kludging minixfs to work with ICD and BGM partitions, an idea
for a possible kludge came to me late last night. I'll give it a shot
tonight....

Cheers, Steve

4847. SC1224 for cost of shipping

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-15 19:43:14 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <35a84i$nrj@mailer.fsu.edu>
Source record: 30427
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have an SC1224 monitor that I am willing to give to anyone willing to
pay the shipping to get it to them. The only catch: it doesn't work!
It is in great physical shape, and had a very nice picture when working,
so I hate to just throw it away. It does not come on at all when power is
applied (no hum or anything). It could be something big (like the flyback),
or it could be a loose wire or other trivial problem. Heck, it would make
a great aquarium for some enterprising Atari fanatic.

If anyone wants to tinker on this beast, or just needs it for parts, send
me some email.

For the 3.5 in.IDE drive you need a 44/40 adaptor cable, and a suitable
power supply.

I have seen a 3.5in. IDE installed inside the standard Falcon case, they put
it below the floppy which was changed to a very thin model. Not sure what
they did with the power supply though. I wouldn't use the standard Falcon
PSU.

Hope this helps.

Why not stick to the normal Atari standard, SCSI, here a SCSI drive is only
$50 more....

Another reason there is far better support for SCSI hard drive set ups,
like most utility software does not support IDE...

Another reason, there are far more SCSI host adapters than IDE ones, and from
what I know the IDE ones are German, verry little support out side of Germany
, I should know I am trying to get support for my Overscan software...!!!

So be warned.....!!

Could be a problem with ICD's implementation of Rwabs().

> As far as I know big partitions require an XHDI compatible driver.

Not necessarily, it is possible to create and use a minix filesystem on
a huge BGM partition with an AHDI compatible driver. If I remember cor-
rectly I had to edit the bootsector by hand and pass the exact number of
1KB blocks on the commandline. Off course the ICD software is not AHDI
compatible (just look at the kludges that the minix filesystem driver
contains to make it work at all with the ICD driver).

However, I would strongly recommend the installation of an XHDI >= 1.10
compatible driver to anyone who plans on using minix filesystems under
MiNT. Currently the XHDI protocol is supported by HDDriver and HuSHI,
both work fine with mfs 0.6.

I've got the drive up and running on a Falcon I've been borrowing for quite
some time, but I had to get myself a SCSI -> SCSI 2 cable which in my
opinion is ridiculously overpriced. I've learnt a bit more about the drive,
like the term resistors are present (thanks to all how pointed what they
looked like out) and I know that there appears to be no parity jumper on
the embedded controller. The Falcon loves the drive, it's very fast indeed.

Not a lot of use to those using ready-made computers, but using a 16-bit
latch and a 16-bit buffer you can arrange the wiring so that writing out
to the latch and reading back from the buffer gives you byte swapping,
bit reversal etc. You can't get much faster than that!

Dave

What would you like to know? It is equivalent to the original Link, with the exception of accepting parity and having a small LED to show proper power is reaching the unit (thus solving the two more common problems with it). It has the ability to use Floptical drives (no big deal). Other than that, and the fact that it is external, it is pretty much a standard ICD host adaptor. Its software is special, and upgrades must be ordered directly from ICD (you can't use the stuff they put on Genie/Compuserve).

> to how I could hook it up using the floppy port or something.

Easiest way: purchase an SF354 single sided external drive (these are
dirt cheap, as they are not particularly useful nowadays), and swap the
mechanisms. You will then have the magical Atari sub-board present in these
drives that makes them work properly. It should just drop in and work.
At worst, you might have to modify the case slightly if your eject button
is in a different place.

If you want to try and hook it up directly, you will need a power supply,
some kind of case, a cable you can cut up, and some instructions. The latter
are available on atari.archive.umich.edu (ibmflop.lzh and genflop.lzh).
I get the impression that there are a number of "fiddley bits" associated
with using generic floppy drives with the ST (primarily making sure that
media change can still be detected), but since you have an Atari mechanism
it might be easy (then again, if the thing that fixed this is on the
sub-board in the external drives...). Good luck.

4867. Thanks for help on assembler: $70 VBI

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-16 20:55:02 UTC
From: rrk@vixen.cc.bellcore.com
Message-ID: <35d0n6$aav@athos.cc.bellcore.com>
Source record: 30302
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Thanks much to all those who helped me with understanding
the role of register $70 in assembler for the ST.
As I now understand it, the machine on its own checks $70 every
vertical blank (it interrupts the current process to to this),
and goes to the address in the $70 register.
Whatever instructions are found at that address, the machine will
perform, and then discontinue the interrupt to resume current
processing. At least I think that is what is going on now.
This makes me wonder if there is a practical limit to the number
of instructions one can ask the machine to do during this vertical
blank interrupt. Anyway, I appreciate your help very much.
My studies continue. Now the ST Format tutorial is trying to
teach me why dividing the sprite frame number in an OCP Art
file by 16, and then multiplying it by 640 gives me a sprite.
Beats me. Anyway, I'll keep pondering. Thanks again for the earlier
help!

4868. Software for sale or trade

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-16 21:28:58 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <35d2mq$5kh@mailer.fsu.edu>
Source record: 30296
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For sale or trade:

Below are a bunch of ST items I want to sell or trade. For buyers, highest reasonable offer gets the item, with preference going to those that buy more than one item. Shipping will be negotiated with the offer.

As for trades, let me know what you have and we may be able to work something out. I am looking for some games (Vroom, Armourgeddon, Prince of Persia, Flight of the Intruder, and many others), Stereotek 3D glasses, working Wico bat handle or Ergo joysticks, European ST magazines (ST Action and ST Review particularly) and probably lots of other stuff. Cash can make up for deficient trade material from either party. Shipping will be negotiated with the trade (though for trades, I often suggest that both parties eat the shipping). Don't be shy, send me some email and let me know what you have to trade.

All of the items below are original commercial products owned by me. Unless otherwise noted, all original boxes, manuals, and disks are included. I have cheats for some of the games, and will include them with the sale/trade.

Please reply via email.

****Application and Utility****

Tempus v1.x, excellent text editor, not as good as Tempus II, but no slouch either. Blazingly fast (hence its name), even on a box-stock 8mHz system. Designed for programming, great for general editing as well.

Neodesk Command Line Interpreter, v. 2.0, adds a command line interface to Neodesk with MSDOS/UNIX style commands. More commands can easily be added (the GNU versions of standard UNIX utilities, for example). This version is really more MSDOS-like than UNIX-like, but the new version 2.1 (to which this can be upgraded) is supposed to be more UNIX-like. There are a couple of neat things about this CLI. First, it pops up in a window on the desktop, so a CLI is only a mouse click (or keyboard macro) away. One can drop batch files onto the CLI icon to execute them, which can be quite handy. Finally, it is quite small, primarily because it reuses the routines in Neodesk to do standard file operations (i.e. when the CLI copies a file, it uses the code already in Neodesk to do it). Only works with Neodesk.

Wordup v3.x, Neocept, with the large thesaurus and large dictionary extra options, plus lots of Genie notes about bug fixes and work-arounds. This is an excellent WYSIWYG word processor, but it does have some bugs. The rights to the code were purchased by Atari (and some of the code used in Atari Works, or so I hear). It is not buggy enough

to be unusable, just irritating at times. This is the final version
that was released.

TurboJet, Neocept, fast GDOS print driver for HP Deskjet and Laserjet printers,
includes a bunch of 150 and 300dpi fonts. Claims to be 200-500%
faster than other HP drivers (for that time, I don't know if there
are faster ones out now).

Microsoft Write for ST, buggy WYSIWYG word processor, the only Microsoft
product ever made for the Atari that I know of, includes a full
copy of Atari GDOS. Can be run from floppies and a ramdisk (Jeez,
did I really do that? I must have been really patient back then :-).
I managed to produce a bunch of papers and letters with it using only
a floppy and color monitor, so it is useful.

Personal Pascal, ICD, I believe this is the final version of this compiler.
The only limitation with it that I know about is that one cannot
pass functions as arguments. Other than that, it is a complete
Pascal compiler environment. The lack of this feature will not
hamper most Pascal programmers, IMHO. Good docs on both Pascal and
the Atari programming environment (it's a big fat softcover book).

CAD 3-D v1.0, Antic, original disk accidently laundered (don't ask :-),
includes original docs plus backup floppy. This is not really for
architectural design (i.e. Dynacadd or Autocad), but to make nifty
3D animations for fun.

****GAMES (Arcade Action)****

Alien Syndrome, overhead view scrolling shoot'em up, lots of fun for two
simultaneous players. Plenty of fast and furious shooting.

Captain Fizz Meets the Blaster-Trons, Psygnosis, sort of like a Gauntlet II
in space, best with two simultaneous players (screen is split to give
each player their own view). Overhead view, destruction galore.

Xevious, Mindscape, port of the stand-up Arcade game Xevious, vertical
scrolling "fly over the landscape shooting and bombing everything"
game.

Baal, Psygnosis, Excellent platform/adventure game (mostly arcade action).
Future setting, sideways scrolling, large sprites, good guns. This
is a pretty hard game, but lots of fun.

Enduro Racer and Crazy Cars, combo pack, no docs, Enduro Racer is a cross
country motorcycle racing game, Crazy Cars is a racing game. Both
are OK, though quite old.

Super Cycle, Epyx, no docs, oval track motorcycle racing.

Custodian, futuristic platform shoot'em up game, excellent graphics, fast
scrolling, lots of weapons, etc.

Eliminator, strange driving/shoot'em up game, lots of different weapons and bad guys.

Frostbyte, Starsoft, side-view platform game, I would recommend it for a small child (in terms of its difficulty). A bit boring for us big children, IMHO.

President Elect 1988 edition, SSI, presidential election simulation, graphics are quite lame (mostly text, in fact), but I suppose a political process fan might like it. It does not appear to be particularly tied to the 1988 elections, and has data for US elections all the way back to 1960. Can apparently be used to predict elections as well.

From: rgivan@cix.compulink.co.uk
Message-ID: <Cw8z7E.D34@cix.compulink.co.uk>
Source record: 30325

> The TT-High flicker/jittering is a known problem on several revisions

Interesting. Its amazing what you learn!

Is this flicker there from the moment you turn it on, or does it gradually appear? Mine is the latter.

I've only recently bought the machine second hand, and the previous owner swears he never had this fault, I'm inclined to belive him as he told me about other minor faults that were not otherwise imeadiately obvious.

> The flicker patches does mostly consist of soldering an extra lead

What sort of klead is this? Ground?

Anyway I'm trying a new PSU at the moment. Tonight I externally mounted an IBM PC-XT style 150W PSU. I kept the internal PSU fan (unbolted it from the PSU and stuck it in place).

I've had the machine on 2 hours so far. The output from the internal fan is *cold* while the PSU fan is barely warm (much less warm than the PSU fan used to get).

Its a case of so far so good. No noticable flicker, and after 2 hours its normally quite noticable. Might not cure the problem entirely, but can't hurt trying.

:-)

Roland.

@CiX

OTOH it would be nice if I could cure myself of examining the screen carefully every few minutes. The flicker was not noticable until you looked for it. *Then* it looks aweful! ;-)

4871. Uniterm 2.0e015

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-17 00:33:30 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <35ddgq$i1p@mailer.fsu.edu>
Source record: 30307
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have added a file in /Telecomm on atari.archive.umich.edu that has the instructions for downloading the last version of Uniterm, 2.0e015. This has been the final version for several years, but I'm sure most folks ended up with a previous one, as the author requests that no site other than the one mentioned below carry this last version. Atari.archive has the last version released for general distribution, 2.0e011.

So, for those that like Uniterm, and want to have the final version, it is on the machine chsun.chuug.ch in /software/atari/UniTerm. Please do not upload it elsewhere, as per the author's wishes (this paragraph is essentially what the file on atari.archive says).

I have been unable to get ahold of the author, Simon Poole. I would like to ask him to release the source (so someone could add Zmodem capability), or at least to allow atari.archive.umich.edu to stock the final version. If anyone has a current email address for Simon, please let me know.

For those that don't know, Uniterm is a telecommunications package that is particularly suited for UNIX connectivity. It does excellent vt100 emulation, and uses the full screen (with standard system font) for a large fast terminal display. It offers a powerful macro language, which can be used to automate tasks (or even to add Zmodem capability, in a fashion). Even after all these years, I would rank it very high in the list of ST terminal programs.

4872. B/W Video problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-17 01:57:39 UTC
From: anmar@netcom.com
Message-ID: <anmarCw9444.5uF@netcom.com>
Source record: 30297

I have almost always had problems with using my B/W monitor
with my Atari 1040ST. The problems don't occur when I
use my color monitor.

Basically, the screen starts slowing going to inverse video.
The screen appears to shimmer as it is going through the
transition and sometime I can see a visible grid matrix on
the screen (maybe at chip boundaries?).

This problem has gotten worse as time goes on. Unfortunately,
I need to use B/W with the CUBASE music software I have.

Anybody else experienced this? Is there a quick fix like
giggling the video board? I guess there must be a seperate
board for B/W and color.

Any help would be appreciated?

4873. CaTTamaran woes - TT hardware help

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-17 07:20:22 UTC
From: umcordes@cc.umanitoba.ca
Message-ID: <35e5bm$2e7@canopus.cc.umanitoba.ca>
Source record: 30309

Hello,

I recently ordered a CaTTamaran TT 48Mhz upgrade for my TT. I had it installed by a local dealer whom consequently had many problems installing it. Apparently I have one of the earliest mother boards that Atari produced and the CaTT requires some playing around with to get it working.

Anyways, he finally got it installed so it would actually boot (which is the way it is now), although to get the machine to a workable state, I must go through about 8-25 reboots. It usually gets part way through the boot sequence (auto folder prgs and such) but then bombs out (at seemingly random points, but as you reboot more and more, it seems to bomb out later and later). After doing this for a while, I'll finally get to my desktop and be able to run programs and such. It sometimes bombs out when running a program, but after another boot or 2, it will run flawlessly (at 150% the CPU speed) for hours.

What may be the problem? It's like it needs to get "warmed up" or something. But that's silly...

I'm still happy with my purchase, although I _really_ would like to solve the boot-up bombs problem.

>If you click on a dummy Zip file then click on the exit
>button, all is OK..!!!

I'll have to check this bug out. I myself have had problems with another
bug. If you go to extract a zip file (usually by drag & dropping on the
STZIP.PRG icon), and then select, say, the first 2 compressed files, and
then press extract, only the 2nd one will be extracted! For some reason,
it seems to occasionally ignore the first file I have selected. Strange.

Anyone else had this problem?

Subject: Re: Help needed with fixing dead ST's
Newsgroups: comp.sys.atari.st.tech

In article <1994Sep15.082503.11171@spuddy.uucp> you wrote:
: Greetings...

: I have a number of "dead" 520 & 1040 ST's that really need restoring to life. If
: you have any experience with dealing with these machines specifically I would
: greatly appreciate any advice or common problems that you have noticed,
: before I waste hours on each one.

The most common problem that I've seen happen to ST's deals with the
gradual un-seating of its EPROMS. This normally happens due to
temperature flucuations, expanding and shrinking the sockets/pins until
there is a loss of connection.

Case of power indications (eg.. power light is lit on the Atari), but no
video, no disk access when turning on:

So first off, simple press down firmly on each EPROM, and you should hear
a cracking sound as they re-seat.

If you've got a machine with SIMM sockets, reseat those as well.

And- in the case of having absolutly no power indications at all, well
then its most likely a power supply gone bad.

There are a variety of other things that can go wrong, but the EPROM
problem is probably the easiest to fix.

I need help: I'm running Spectre GCR v. 3.0 on an Atari 520ST 2.5/45MB config.

Question 1. What is the highest version of Spectre?
Q2. Where can I FTP or call to get an upgrade copy of Spectre GCR?
Q.3 Anyone using an Apple Imagewriter II Printer too? What are the address switchs set to, and how did you config. Spectre?

I have not been able to reach Dave Small or Gadgets by Small, Inc. for tech assistance, so, to any Atari gurus who can point me towards Spectre GCR support, I will be eternally grateful.

I'm very pleased with the way the Atari and Spectre work. It was quite a learning experience getting an optimal set-up; I would be glad to give pointers to the GCR novice.

Sorry for I had not got the whole original message. I think, I've the
same problem with a different SCSI-II-HD, an IBM GigaByte one. I've also
an ICD SCSI Host Adapter but the IDCheck.PRG will not find the HD, which is
surely correct terminated. For I'd spent more than 1000 Deutsche Mark for
the HD, I'm similar frustrated as the sender from the original mail.

This is indeed completely Wrong, you can boot from a BGM
partition , so were do you get your outdated info from....

If fact booting is just a sector thing, nothing to do with Patition size
at all....

Commercial products:

You could use Assemble which is fast !
Assemble has a English users interface (with
online Help) The docs I have are in French,

but it could have English docs.
Assemble is available at 490 french francs
($ 100) you can also get it bundeld with
Adebug (powerful source & low level debuger)
for 890 FF ($ 200 ?).

To keep you from re inventing the wheel <G>

------------------------------ snip ----------------------------------

One of the ultimate ironies of the Atari ST system is that the computer is not upgradeable. I'm sure that many people from other computer platforms would be very quick to agree. Many others, such as Dave Small, and probably the people at ICD INC would take some small exception to this idea. I too would have to take a minor exception. Because of the relatively closed architecture of the ST this computer system has become a hackers heaven. It is with this in mind that I have written this recount of my experiences using SIMMs to upgrade STs to 2 1/2 megs.

It seems like each time I read an article about upgrades there is a long warning about warranties and technical competence. Why should I care if you ruin your computer? As far as your warranty goes, if you remove the screws on the bottom your warranty is void. My upgrade will cause your warranty to explode and possibly ruin your computer desk in the process. There is the small reminder that since the warranty is only 90 days in the first place, the odds of your warranty being valid at this time are nill. One small consolation, if you do ruin your computer while attempting this upgrade you can always buy an STe and use the SIMMs there.

The reasons I developed this particular style of upgrade are two fold. The first is that I just wanted to see if I could do it. The second has to do with my personal feelings about sockets that plug into existing chip sockets and cause permanent damage.

There are a couple of advantages to my upgrade techniques. 1} I use SIMMs, which are noted for their reliability. 2} The upgrade requires only two minor jumper/foil cuts. 3} All connections are soldered which means no sockets to ruin and if properly done provides extremely reliable long term operation.

Since you are probably going to try this anyway, you should go ahead and get yourself a pair of 1 meg x 8 SIMMs. If you should happen to get the 1 meg x 9 SIMMs, that is ok too. The speed isn't that important, but it is hard to find a set of SIMMs these days slower than 100ns anyway. While you are in the getting mode, get yourself a few feet of 28 gauge Kevlar wire such is used for wire wrapping. You will also need a decent temperature controlled soldering iron running between 750 and 800 degrees. Take your 25 watt Radio Shack type iron and throw it away while you are at it. Those small and unregulated irons are a good source of just the right types of static known for killing CMOS circuitry dead. I should also mention the fact that the longer a soldering iron remains on the circuit board, the greater the chances are that you will begin destroying the foil patterns.

The major problem I have encountered while upgrading STs is the numerous version revisions. There are no fewer than 6 different styles of mother boards and many of them use different circuit symbols for the various components. For this reason I will not be referring to any of the components by their circuit

symbols. All references will be by component name, such as the MMU, or the upper and lower RAM banks. I simply have to assume you know what your are doing.

I begin the upgrade by removing the mother board from the computer and placing in on an anti-static workbench. Depending on the model of computer, the upper bank of ram chips must be removed. By upper bank I mean the row of chips connected to the CAS1, and RAS1 lines from the MMU chip. You may verify this by measuring from pins 18, 21, and 22 of the MMU chip. CAS1 H = 22, CAS1 L = 21, and RAS1 = 18. The corresponding locations of the CAS and RAS lines on the ram chips are pins 15 for CAS and 4 for RAS.

The ST uses two rows and four columns of ram chips in their memory addressing scheme. The Row Address Strobes (RAS) are labeled RAS1 and RAS0, and the Column Address Strobes (CAS) are labeled CAS1 H, CAS1 L, CAS0 H, and CAS0 L where the H and L stand for High and Low. All the lines using the 1 are related to the the upper row and the lines labeled with the 0 are used in the lower row.

You will probably not find the above mentioned labels printed on your particular mother board. The only time I remember seeing this done was on the 520ST with modulator. Don't expect it.

If you are wanting to do this upgrade on the early 520 you should remove the entire set of ram chips. Your final upgrade will be 2 megs instead of 2.5. There is just no clean way to install all the wiring needed to installed chips.

Once the ram chips are removed it is time to mount the SIMMs and prepare the wiring. On the machines where the ram chips are mounted under the keyboard, there is a good place to mount the SIMMs right above the upper bank of ram chips. I use strips of double sided adhesive foam which I attach to the back of one of the SIMMs. I then stick this SIMM to the mother board. When the SIMM is mounted it is about 3/4 inch above the spot where the ram chips were removed. I then take another strip of adhesive foam and cut it to a width of 1/4 inch. This strip is placed on the top rear of the SIMM I just mounted on the board. Now I carefully place the second SIMM directly over the first. It is important to line the two SIMMs up so that they match exactly. When completed I have the two SIMMs stuck together, with one on top of the other. From this time on, consider the top SIMM to be the "High" and the bottom SIMM to be the "Low" column.

For the STs with the ram under the keyboard, the upper bank of ram chips just happens to be the ones farthest away from the front of the machine. It also happens that the "High" column is o the left and the "Low" column is on the right. To make remembering easier I use a marker and mark the center between the

two columns. That make eight on the left and eight on the right side of the mark.

If you have one of the STs with the ram under the powersupply, you will need to use the ohm meter and verify the locations of the upper and lower banks. While I have looked at one of these beasts I have not done an upgrade on this particular style so I cannot suggest a location for the SIMMs.

The following pinouts will be critical to your successful upgrade: 1 meg x 8 SIMM

```
0 0 0 0 0 0 0 0 0 1 1 1 1 1 1 1 1 1 2 2 2 2 2 2 2 2 2 2 3
1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0
| | | | | | | | | | | | | | | | | | | | | | | | | | | |
V C D A A D A A V D A A D A A D A A N D W V D N D N R N N V
C A Q 0 1 Q 2 3 S Q 4 5 Q 6 7 Q 8 9 C Q E S Q C Q C A C C C
C S 0 1 S 2 3 4 5 S 6 7 S C
```

256K DRAM Pinout

```
1> A8 16> VSS
2> Din 15> CAS
3> WE 14> Dout
4> RAS 13> A6
5> A0 12> A3
6> A2 11> A4
7> A1 10> A5
8> VCC 9> A7
```

If you notice, there is no A9 on the ram chips. This is the new address line and special consideration is required. I will cover this further on.

I start by making a check list numbered from 1 to 30 with two columns, one for the upper and one for the lower columns.

PIN 1
Beginning with pin 1 on the SIMMs take the kevlar wire and strip back about half an inch. The neat thing about the wire is that it fits perfectly into the holes on the SIMMs. Since the Vcc line is common to both SIMMs I insert the wire into the lower SIMM and solder it into place. I then attach the wire to the upper SIMM and solder it. Because the Vcc line is what it is, I now use a slightly larger gauge wire and run it from pin 1 of the SIMM to pin 8 of the nearest vacant ram. In order to keep things neat, I keep the wires as short as possible without any undue stress.

Since I removed the 16 ram chips I have my choice of spots for the placement of the wires run from the SIMMs. The following considerations should be taken into account.

The address lines A0 through A8 are common to all the chips.
The CAS lines are split so CAS1 H is common to the upper column
of 8 chips and CAS1 L is common to the lower 8 chips. The RAS1
line is common to all 16 chips. The DQ lines are separate and
require special wiring.

PIN 2
The CAS line on pin 2 of the SIMMs needs to be split up. The
lower SIMM is wired to any convenient pin 15 of the lower column.
The upper SIMM is wired to pin 15 in the upper ram column.

SIMM UP 2
---------- snip ----------

PIN 3
DQ0 is split. The lower SIMM is run to the first chip socket of the lower column. This should be the chip closest to the spot previously marked as the center. Both columns run from left to right. The DQ label corresponds to the Din or pin 2 of the ram socket. The upper SIMM is wired to the ram socket farthest to the left.

PIN 4
A0 should be wired from the lower SIMM to the upper SIMM. It should then be wired to the nearest ram socket pin 5. The only major concern here is neatness.

The rest of the wiring follows the same order listed above. Pin 21 of the SIMM should be jumpered between the two SIMMs and then run to ram pin 3. Pin 27 of the SIMMs is also jumpered between the two SIMMs and then run to ram pin 4.

PIN 18
The A9 line is the new address line which is required when 1 meg chips are used. This line should also be jumpered between the two SIMMs. Using the Kevlar wire I run to one of the holes where the ram chips were removed. What I like to do is drop the insulated wire through the hole and run it over near the MMU. The idea here is to run the wire from the SIMMs pin 18 through a 33 ohm resistor (which you need to come up with) to pin 64 of the MMU. I like to use a little shrink tubing over the resistor connections since this is an outboard hookup. Using a couple of convenient holes for wire routing simply makes for a neater job.

I follow my check list exactly and mark each connection as it is made. Since the key to a well done job is top quality craftsmanship, I am careful to do the best job I am capable of.

There is now a final set of steps which is required to make this upgrade work. Because the upper bank of chips was removed, it is important to do something about the routing of the Row and Column address strobes. The configuration of the computer as it now lies consists of an illegal ram configuration. By this I mean that you have a 512k lower bank and a 2 meg upper bank. This needs to be reversed.

Reversing the CAS and RAS lines is simple but can be tricky. If you don't get exactly right your computer won't boot at all. It won't hurt it, it just won't work. What I like to do is locate the resistors these line pass through. The technique is to identify which resistor is associated with CAS1 H. I then identify find the resistor for CAS0 H. Once this is done I will lift one end of each resistor. Using whatever technique i can that is clean, I cross wire the ends of the two resistors to their respective holes in the pc board. I then do the same for the CAS1 L and CAS0 L lines.

Finally I identify the RAS1 and RAS0 lines. These two lines can be found side by side with the CAS resistors. On the foil side of the circuit board I cut the foil between the pads for RAS1. I then do the same for RAS0. If you look at the spot where the resistors are mounted, it looks like there is a place for two more resistors to go. This is usually where the RAS lines are found. The final step is to run jumper wires in order to cross wire the RAS0 and RAS1 lines.

It is important to check your work with an ohm meter at this point. I use a Fluke 77 which has a diode checker position. This setting of the meter is safe for CMOS circuits boards and also makes a beeping sound whenever it senses a short. The following measurements should be taken and verified.

MMU Pin # SIMM pin # New Identity

6 <==========> upper 2 CAS0 H
7 <==========> lower 2 CAS0 L
8 <==========> both 27 RAS0

You should also verify the new CAS1 H, CAS1 L, and RAS1 lines. These lines go to the remaining ram chips which are now your new upper bank.

Ram Pin # MMU #

4 <==========> 18 RAS1
15 (right) <===> 21 CAS1 L
15 (left) <====> 22 CAS1 H

This completes the upgrade. If you want to go to 4 megs all you need to do is make a few minor changes. Remove all the ram chips and of course use 2 pairs of SIMMs. Wire one pair into the upper bank position and the second pair into the lower bank position. You do not need to do anything about swapping the CAS and RAS positions.

If you are doing the upgrade on an older 520 that does not use the 1040 mother board you can also ignore the part about the CAS and RAS swapping.

I would like to suggest that you get ahold of some type of memory tester program. There is one in the GEnie library written by Barry Orlando which will do the job nicely. Another program written by Willie Brown does a good job as well. It is also possible to use NeoDesk to look at but not test our memory. With Neo Desk simply click on the desktop info and read the screen. there is a line at the bottom of the screen which identifies free memory.

I will admit that once or twice my upgrades did not work at first and required some trouble shooting. If this is the case, you will need to double check your work. Each time I had trouble

it was caused either by a faulty solder connection or by getting confused when I swapped the CAS and RAS lines. If you get these lines wrong, you will probably not hurt anything, but your computer will lock up during the boot cycle. The only way to really hurt things is by wiring your VSS and VCC lines to the wrong places.

There is one other place you may get some trouble.
If you are upgrading from 512k and the computer has never had a memory upgrade before, there is a possibility that the MMU chip could be bad. This can occur because the CAS1 and RAS1 lines have never been used or tested. I ran into this problem once. It also doesn't hurt to remove and clean the MMU and its socket. This can pay off on the older machines.

Just in case I have inspired you to go out and do this upgrade, let me advise you that it takes me about 6 hours to do this job. Using a good desoldering machine to remove the old ram chips takes about 1 hour. You could also use a fine pair of cutting pliers and clip out the chips. This would be much faster, but I like to save the chips for other projects. The fastest upgrade I did was on a 520STFM where the 1040 mother board was used. There were no ram chips to remove.

Now that it is all done, it is time to sit back and enjoy your work. 2.5 megs is a pretty nice upgrade. The cost was fairly reasonable, the SIMMs cost $90 to $110 a pair and 100 feet of Kevlar wire costs about $5 bucks. The only other cost is for the resistors and depending on the computer you will need from 1 to 4 of them. I recommend using 1/8 watt 33 ohms.

I hope that this information is of some value to those of you who have read it. You may use this document in your club news letters or magazines provided it is printed in its entirety. You may not remove my byline cause I need some claim to fame. Finally if you should choose to perform this upgrade and kill your computer, you can always buy an STe and sell your dead computer to me, really cheap. Heck, I can always use a few more spare parts.

4894. Hooking ST formatted 540mb Quantum to PC....

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-18 12:49:35 UTC
From: mattk@netcom.com
Message-ID: <mattkCwBsyn.Jz@netcom.com>
Source record: 30319

Well, the real question is what would happen? The ST is supposed to use PC format by and large. I remember that ST floppies are basically the same as PC floppies except for the ST's not having a serial number. What about HDs? Will the PC read the partition table correctly? Can a PC deal with "Big Gem" drives (thatis over 16/32mb using bigger than 512 byte logical sectors)?

Thanks,
Matt

Yes, I have, but I then switched to ST Zip 2.7, which doesn't have
that problem (although I don't know about the first mentioned
problem)

This is purely a convention of the C runtime code, since the PDP-11 has
no 32 bit instructions. The order could just as well have been
purely little-endian, but I guess the runtime support authors were
big-endians.

yes - but you probaby bought your 520ST in 1986 when there weren't any
other options to upgrade the memory.

Nowadays there are some very neat and quite cheap boards which do the same
job, and are far less risky for those people less accustomed to a soldering
iron than you are.

Roland.

Source record: 30328

gauger@esvx12.es.dupont.com wrote:
> I need help: I'm running Spectre GCR v. 3.0 on an Atari 520ST 2.5/45MB config.

> Question 1. What is the highest version of Spectre?

The highest released version is 3.0. Version 3.1 is supposedly ready, and
Dave Small made a "really really soon now" annoucement (his first in years)
a month or so ago. I suspect it will eventually come out....

> Q2. Where can I FTP or call to get an upgrade copy of Spectre GCR?

The 3.1 upgrade will probably involve sending disks to Dave Small (not sure,
as mine was 3.0 when I bought it). I got a hint that perhaps Toad computers
might also be able to issue upgrades, but that is not confirmed.

> Q.3 Anyone using an Apple Imagewriter II Printer too? What are the address
> switchs set to, and how did you config. Spectre?

I managed to get my Star dot matrix to work, but it was a long time ago.
I don't remember having to do anything special, I just plugged it in.
The thing I like about Spectre (Macs in general, actually) is that one can
output anything to a PostScript file and print it elsewhere.

> I have not been able to reach Dave Small or Gadgets by Small, Inc. for
> tech assistance, so, to any Atari gurus who can point me towards Spectre GCR
> support, I will be eternally grateful.

Dave Small is a bit of an enigma. The initial excuses for the lack of new
Spectre versions (what, almost four years ago, maybe more) involved several
plausible yet fantastic events in his life, for which he ignored the
Gadgets by Small business in favor of his family (can't blame him there).
Then, there was a long period of no contact. Then, the surprise annoucement
a few weeks ago about 3.1 coming out any day now. Then, nothing....

He is a neat guy, and I like reading his articles and buying his products.
However, I think perhaps he has waited too long for a lot of Atari folks.
IMHO, he should have released something (anything) sooner than this.

>a month or so ago. I suspect it will eventually come out....

I thought this announcement was made last February which is much more
than a month ago. In it he said that 3.1 was finished and implied all
it needed was packaging. Also he promised GBS support again. I think
this statement was made just to keep Spectre upgrade hopes (which were
and are diminishing) alive.

IE>Can someone give me a clue of what soft- and hardware is available
IE>(incl price tag) for Falcon in the area of hard disk recording.
IE>I have a DAT, in my homestudio, that is equipped with optical in, out
IE>+ digital coax in. Is there anything developed that lets me do hard
IE>disk recording on say 8 tracks on a Falcon and then do a mix down
IE>to DAT ? That would probably make me switch from my old, but trusty,
IE>ST to a Falcon. The sound quality must of course be good. No noise please :-

The Cubase Audio v2 with 16 audio tracks should do.
Steinberg has also some other peripherals that use your DAT device ...
About the noise... what noise?

You will need a Falcon with 16meg for some very serious work and an
external hard disk (~500 MB and up). There are also some hardware
modifications for the falcon that make it sound better.

The prices for the machine/software are usually different here in Greece
so I'll skip that part...

I just checked, March 24 is the date on the annoucement. So, about 6
months ago :-(. My, time flies when you're having fun!

This could be. I would like to believe he is just having some bad luck,
but it has been a long long time.....

Heck, I'm happy with Spectre as it is, pretty much. I have not found
anything that crashes it, and I wouldn't want to run System 7 on a
4mb 68000 anyway. If I had a TT, I'd be rather irritated though.

It should be included with the GNU binary utilities, probably named
gcc-ar.ttp. Merely make a copy, call it ar (or ar.ttp) and place it in your
path.

Either that or pleace the line:-

AR=/path/to/gcc/compiler/gcc-ar.ttp

in the Makefile.

4910. Web pages for Atari!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-19 13:02:19 UTC
From: msh@mserv1.dl.ac.uk
Message-ID: <35k24r$8sg@mserv1.dl.ac.uk>
Source record: 30337

I just wanted to let you know I have started creating a Web page for the Atari. It is to cover all formats and I would appreciate it if anyone could mail me with ideas for things to include. Also any reviews, news or general commentary will be welcome and will be considered for inclusion. I hope to have a first version up before the end of the week so I will keep you all posted.

I am doing this page for two reasons:

1). To practice writing HTML scripts (this will be my first so expect it to improve with time).
2). To support the Atari which seems to get little mention (let alone whole pages) dedicated to it on the Web.

I myself have a 1040STF and 4Mb Falcon with 127Mb HD. There is also an Atari Lynx in our house so I can comment on a fair range of Atari hardware. I also have access to an Atari Jaguar from time to time so I hope to bring you the latest on that also.

Please send any comments or pieces for inclusion directly to me (PD and Shareware will also be accepted if UUEncoded).

Thank you for your time,

Mark msh@dl.ac.uk

As far as I know, it _did_ have an ISA card slot. The Gemulator-card is
just (far) too big to fit in.

>Actually, I spent a bit of time looking for a PC laptop that had at least
>two ISA card slots (one for GEMulator, one for Ethernet) and could not
>find one. If your friend does have an ISA bus in his machine, I would be
>interested in knowing what the manufacturer/model/cpu-type is.
As soon as I know I'll E-mail this to you.

Anyway, I got an idea myself and i'd really like to have your opinion about it:

Would it be possible (since there are just two TOS-ROMS on the GEMulator
card) to store the contents of the chips somewhere in RAM? I already have the
contents of these chips in two files (found them in public domain).
Then, every time the GEMulator-program wants to use the TOS-chips (which
aren't there) this could be 'redirected' to the files in RAM, couldn't it?

It's just a stupid idea, but would it be possible, and if so, would it be legal to
change the GEMulator program so that it can operate without the card?

Thanks again,

Martijn from Holland.

Sorry if I'm babbling nonsense, but I haven'y been following this thread. I'm assuming that you're talking about assembly on the ST.

The fastest way I know of swapping two bytes is to make the table in which the bytes are with a filler byte in between so you can just use a MOVE.L and then a SWAP to switch 'em.

The key thing here is to adjust your data structures so that you can make the most of the instructions you've got. One of the most important lessons in demo coding...

> What may be the problem? It's like it needs to get "warmed up" or
> something. But that's silly...

I suspect its exactly that. Some component in your system requires to be
at a certain temperature before it will run at 150% speed.

Somebody around here had a PAK/3 with a similar fault. Needed 15mins warm
up before it would run at 40Mhz.

Its normally the other way around though. The machine runs fine *until*
it warms up, and then can't cope with the speed at that heat.

I supose it could be dry joint. When it heats, its expands and makes a
better connection.

:-(

Roland.

For a 19" Moniterm monitor (Viking?), I would like to know:

1. Can this be hooked to a TT? What is involved?
2. Can this be hooked to an STE? Ditto.

There is a card for the MegaST computers that fits the internal megabus connector. I'm pretty sure I don't have one in the STE (replaced by a VME card slot). I know there are several monitor cards for the STE/TT, but can any of them drive a 19" mono monitor?

Thanks in advance for any assistance.

How about this one then:
If you create a directory in the zip with 8 characters it puts the dot on
the end so you get \12345678.\
You now get a good ole fashion bus error should you try to put anything
in it. I guess it'll also crash when you extract files from that directory.
I'd report this to the author but I don't have his address to-hand.
I guess someone else has already done it anyway.

On the subject of memory I do wish ZIP and Lharc for that matter used more
memory than those blasted temporary files !!
I have 2mb and a slow hard disk and stzip always appears to use around
300k max :-(- its sheer lazyness on the porters side.

Despite that bit of 'constructed critisism', STZIP has a nice shell and I
hope its continuly supported.

Paul Finch

(Have you seen that awful bug in the Lharc shell where no matter how many files
you select to compress, it does every in the directory !)

Hi,
I have a nice TEAC 3"1/4 disk drive and I would like to know the jumpers meaning.
They are organized as an array like this:

```
+---+
E |o o| complete ref: TEAC FD-235HF 4240
D |o o|
C |o o|
B |o o|
A |o o|
+---+
2 1
```

For the moment, there are 2 jumpers (AB1 and CD2) and the drive comes from a PC.
Can anyone help me ?
Thank you.

Hi,

Here is the address of my Atari Web page:

http://www.dl.ac.uk/TCSC/disco/mark/atari.html

The page is only a day old and will be updated regularly, but I need your input. This page is for you so you must tell me what you want to see. Please send ideas or things for inclusion to me. Send all mail directly to me and make sure any files are UUEncoded first. I look forward to hearing from you.

Thanks

Mark msh@dl.ac.uk

>VME card slot). I know there are several monitor cards for the STE/TT,
>but can any of them drive a 19" mono monitor?

The monitor can be connected directly to a TT, assuming the monitors input
is ECL (mine is..) Maybe you will have to readjust the vertical hold and
the picture may appear too small, on the left side PCB (facing the back)
there is a jumper wire surrounded by a couple of holes marked A,B,C,D etc.
If I can recall correctly I moved it up to the highest to get a full size
picture. After adjusting the V-Hold and V-Size the monitor served me very
well (Signum!3 is great on it).. But now I'm spoiled by the picture of my
'supposed to be dead, so throw it away' 17" color monitor.. The monitor is
driven by a TSENG-VGA card (yes, from a PC..) in my TT, and runs now in
800x600 at 256 colors...
But for a razorsharp display go for the Viking! The picture is 'rocksteady'
at 71 Hz and the desktop is huge...

I'm running a TSENG VGA card in/on my TT with STGA and was wondering if there were more STGA users around.
I'd like to know what kind of cards are used and in what computer (ST/STE/MegaSTE/TT).

PowerPC chips use this convention also, since they evolved from IBM. However,
I hesitate to refer to it as big or little endian, since it is really just
a convention for numbering bits, and doesn't have the influence that byte
ordering does. That is, the MSB of a byte will always be the MSB of that byte,
regardless of whether you call it bit 0 or bit 7.

This depends on wich revision you have on the motherboard. Mine, which is one of the latest revisions, gets more stable after a while, though the jittering is bearly noticable even at start. On som early revisions, the flickering/jitter was REALY bad when the machine were switched on. The whole uper part of the screen shifted several pixels to the right, and sometimes it looked as if the screen were out of sync.

> > The flicker patches does mostly consist of soldering an extra lead
>
> What sort of klead is this? Ground?

Yes, in most revisions that's the case.

IIRC the existing Falcon software looks only for one IDE drive, so even if you connect an IDE slave either internally or externally, it will only find the one drive.

A Megafile 30 probably doesn't have a SCSI controller in it. Its more
likely to be an old style ST506, MFM/RLL system.

The way to tell:

SCSI drives have one 50way cable from the drive to the controller.
ST506 drives have 2 thinner cables. One is 20way ISTR, but I can't remember
how wide the other one is.

Basically its *very* unlikely you will get a Megafile and SeaQuest running
from the same controller.

:-(

Roland.

It is not possible as the Megafile 30 is an MFM/RLL device.

>At worst, you might have to modify the case slightly if your eject button
>is in a different place.

NO ! NO ! ..

A lot of these drives use a special Back board with a CPU fitted,
this was because some one stuffed up at Atari and ordered the wrong
type of drives, slow step rate, so the fitted a CPU to buffer the step rate..

You will have to remove this CPU and some IC's and add some wiring,
and a new drive connector, definitely not for the faint harted,
I know I did one, was not that easy....

On some STF they used a removable CPU board, but then the cable was to short
to use, these rubish drives have a single line connector...

Just my 10c worth....

Hiya - I managed to break off a pin on my STe's monitor cable __top__
and finally managed to find a new one, however all is ....
not wonderful. The pin marked 'x' in the diagram was missing x...
on my old cable - and the hassle I had trying to find this new ....
cable <g> I'm wondering if I'm supposed to remove it for a '
COLOR monitor - as right now there is no sound on my STe and
low volume on my Mega ST when I use the new cable.

On my mono monitor, however, sound on both machines is fine...

Is it safe to cut this pin? Will someting weird happen?

Help... :}

Andy

[uh, i never made it clear but all pins exist on the new
cable - wondering if this is the difference between mono/color]

4940. Mac / Spectre GCR Q's

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-21 01:43:54 UTC
From: daveh@netcom.com
Message-ID: <davehCwGI57.Jnw@netcom.com>
Source record: 30270

Probably not quite the right place but what the hell.

OK here is my problem. If I manipulate an image on my SUN and produce a PICT file (via pbmplus) how do I get this to Mac and have it recognised as a PICT file.

Preferably I would like to simply ftp it to the Mac but this just gives me a document.

I have sort of worked around the problem by manually hacking the first 128 bytes of a PICT transfered from the Mac to the SUN and pasting it infront of each PICT I transfer back, this is very hacky is there a simple solution?

I can make use of my GCR and Atari at home if I real have to but would prefer simple Mac solution if possible.

Many Thanks,

Dave.

4941. Using internal floppy as an external

HELP ME!!!!

I just (mistakenly) bought a second hand 1040ST (fm) internal floppy drive
and I want to use it as a second floppy.
How can I rig it up to the floppy port on the back of the atari (or is
there another way??)

Thanks in advance

Jeremy

but what if I have to live with a stream of externally generated longwords
without fillers ? Is there something better than
rol.w #8,d0
swap.w d0
rol.w #8,d0
possibly with a movem.l to fill a couple of Dx registers at once ?

>just (far) too big to fit in.

At least one German company is advertising portable PCs which contain
Janus cards (contain 68000, TOS and RAM); so perhaps Janus cards are
smaller than Gemulator cards. The price for a b/w screen portable was
about 3000DM (1200 GBP), can't recall the HD size.

>Anyway, I got an idea myself and i'd really like to have your opinion

>files in RAM, couldn't it?

You have broken Atari's copyright by obtaining ROM images without
paying. *Please* alert the maintainer of the PD library/site where you
found the files and ask them to delete the file(s).

Pic Switsh F V0.5 Darstellung verschiedener Bildformate.
RSC INN SW F Ausschneiden von Bildschirmausschnitten,
zur Weiterverarbeitung zu ICONS
200 Poster SW Druckt ein Bild in vierfacher Gr�sse.
Ausdrucke lassen sich dann zu einem Poster
zusammenf�gen.

ZS Editor SW Zeichensatzeditor f�r 24-Nadeldrucker
(P5/6/7 und andere). Down-Load Zeichensatz.
Basic Ref SW Crossreferenzprogramm f�r GFA-Basic.Hilft
mit vielen Optionen, Fehler aufzudecken.
Incl.Source in GFA-Basic.
MSK Edit SW GFA Maskeneditor f�r GFA-Basic.Generiert mit
einfacher Bedienung eine komplette
Eingabemaske als Quelltext (Form Input).
Retten SW Fortran. Speichert zu lange Dateien in mehreren
Teilen auf verschiedene Disketten.
Seco SW F GFA Verwaltet Bildausschnitte (mit GFA-
Basic-Befehlen PUT GET verwendbar) und
f�gt sie zu Bibliotheken zusammen.
World SW Lernprogramm. Fragt alle L�nder und
Hauptst�dte der Welt ab. Dabei erfolgt die
Antwort per Mausklick.
Enthaltene Landkarten: BRD, USA, Ozeanien,
Mittelamerika, S�damerika, Europa, Asien.

Kreuzwort SW Generiert Kreuzwortr�tsel.
203 Imperium SW Kaufen und verkaufen von �lfeldern, Pumpen,
Tankwagen.Nat�rlich ist auch Sabotage
enthalten.Wettbewerb vorrausgesetzt.
F1 Manager SW Sie m�ssen einen Formel-Eins-Rennstall
verwalten. Ausr�sten von Autos, Verpflichten
von Rennfahrern und einiges mehr geh�rt dazu
BOLO SW Wahrscheinlich die beste Arkanoidumsetzung
Columbia SW Malprogramm mit vielen Optionen.
Kermit v1.1SW F Datenfern�bertragungsprogramm

204 RAM SW F ACC zeigt freien Speicherplatz.
Paintlux SW Sehr umfangreiches Malprogramm. 3
Ein Muss f�r jeden Monochrombesitzer.
Inhalt SW Erzeugt eine Index-Liste von 1st Word-Texten.

Kopieren Sie einfach alle W�rter,
die ber�cksichtigt werden sollen, in eine
Datei."Inhalt" f�gt nun die Seitennummer an.
Index SW Programm zur Erstellung einer Seitenindexliste,
alphabetisch sortiert, Liste aller Zeilenlineale
und aller Bilder. Weiterhin wird ein Lexikon
aller vorkommenden W�rter erzeugt, mit Wortfilter.
BT Konvert SW Konvertiert 1st Word-Texte nach Becker-Text.
Incl. Sonderzeichenumwandlung und Schriftartanpassung.
Type SW Schreibmaschinenkurs in �ber 40 Lektionen.
Von einzelnen Buchstaben bis zu ganzen W�rtern
werden Aufgaben gestellt und bewertet .
Plotter SW F Darstellung von Werten in Diagrammen.
sehr aufwendig und vielseitig.
Morse SW F Morselernprogramm, mit Angabe der T�ne,
und Abfragen der Buchstaben und W�rter.
206 L Painter SW Malprogrgramm Rasteroperationen, Musterspray,
Verwischen, Drehen, Biegen,
Blockladen und Speichern, Fontloader.
Minigolf SW 18 Bahnen , Steuerung per Maus
Richtung Anschlagst�rke. Sehr Gut !!
Solit�r SW Dreidimensionales Solit�r mit guten Grafiken
Deutsch und Franz�sisch.
Roulette SW Was mag das wohl sein?
Surface SW einfache aber sehenswerte Strichdemo
Mazemaker SW F erstellt ein Labyrinth.
Setmaus SW F ACC Mauseinstellung 3 fache Geschwindigkeit,
CAD SW Student CAD nur altes TOS
Gut gestaltetes CAD Programm mit vielen
guten Optionen.Vergleichbar mit kommerziellen
CAD Programmen.
209 Schloss SW F Textadventure
Squixx SW Altbekanntes Spielhallenspiel f�r Maus
und Joy-Stick.Ziel:F�llen von Fl�chen
im Kampf gegen Steinbeisser.
StundenplanSW F erstellt Stundenplan nach Wahl.
APPLE ST SW F �bertragen von Textdaten zwischen ATARI ST
und APPLE �ber v 24 als GFA BAS + PRG.
Cartoon SW einfaches Zeichentrickfilmprogramm.
Erstellen von Animationen m�glich.
MIDI Mus SW MIDI Programm 1 MB und Keybord erforderlich
sehr �bersichtlich und professioneller Editor.
Einspielen �ber Keybord, Noten ausdrucken.
Erstellt f�r Yamaha PC R 800.

210 Kreuz AS SW Eine sinnvolle Art, mit dem Computer zu
spielen, ohne einen Pfennig Einsatz.
Nachahmung des gleichen Gl�cksspielautomaten.
X Modem SW F Datenfern�bertragung

AMIGA Demo F 100% Funktion wird nicht gew�hrleistet.
Spriter SW Sprite Editor
Denk Mal SW es weden Farbe und Ton vorgegeben, und
sollen nachgespielt werden. 3-6 Felder.
Deconv SW Deconvolutionsprogramm zur Bestimmung
von Abklingzeiten.
Bilanzen SW Kontenverwaltung mit Monats,-Jahresbilanzen,
Balken und Kuchengrafiken,sehr �bersichtlich.
Dakar Sw Dateiverwaltung
Rechnen SW F Wirtschaftsrechnen f�r B�rokaufleute.
Funktionen:Zeiteinheiten, Z�hlmasse,
Englische L�ngenmasse,-Gewichtseinheiten,
L�ngenmasse, Gewichte, K�rpermasse,
mathematische Berechnungen, Datenumwandlung,
Zinzrechnung, Dreisatz, Lagerkennzahlen,
Buchf�hrung, W�hrungsrechnen, Prozentrechnung,
Diskontrechnung, Kalkulation, Verfallzeit
Durchschnittsrechnung, Kurswert,u.v.m.
Auf jeden Fall zu empfehlen.
Zeichen SW F Grafikprogramm f�r alle g�ngigen Formate,
mit vielen neuen Funktionen und neuen Ideen.
Z.B.Ordner erzeugen, sroll, 4 Spiegel,q
Spiegel, Mausi, Gag, Effekt (horizontal-
vertikal), Tausch, Peil, Baum, Rahmung,
Kantenform,Mausiform, M-Kreis, Hardcopy.

216 Deskblue SW Gibt dem Desktop ein neues Gesicht.
alle Programme laufen einwandfrei(4 Wochen Test)
Lotto SW F Lotto Analyse. Chancensteigerung durch
Analysierung aller vorhergegangenen Ziehungen.
Eingabe der folgenden Ziehungen m�glich.
Morsen SW F Morsen �ber Centronics-Schnittstelle.
Erweiterung f�r Funkger�t ist m�glich.
Senden von Buchstaben, Kennung, Zeilen u.Dateien.
Morse ST SW Morsetrainer (nicht 100%, aber sehenswert)
Picsw 0.7 F Darstellung und Drucken von Degas PI1-PI3,
NEO, Tiny, NVision, Amiga IFF, Mac Paint,
Mac Startup, CIS Vidtex und alle Atariformate.
QTH LOC SW Programm f�r Funkamat zur Festestellung der
QTH Kenner.Sehr sch�ne Grafiken und Karten
Ratte SW lernende Ratte in einem Irrgarten
REM EX SW F Entfernt REM aus GFA Basic Programmen.
Mazemakr SW F Erzeugt ein Labyrinth f�r Bildschirm u. Drucker
M Help SW F ACC Hilfsprogramm mit den Funktionen:
Disk Formatieren, kopieren, Ordnernamen �ndern,
Disknamen �ndern, Directory drucken.
Netz SW Bestimmen Sie die Gr�sse einer Netzlandschaft.
Kprinter SW F Kassettenh�llendruckprogramm f�r Audiokassetten.
227 Sammelsorium der gebr�uchlichsten Accessories mit ACC Loader

4945. ST Flowcharting Utility?!?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-21 13:39:34 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <2e808c00101ba@elfhaven.ersys.edmonton.ab.ca>
Source record: 30378
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

Does anyone know of a flowcharting utility for the ST? I'm finding that
I'm rapidly becomming aggravated with the pencil-and-paper method. It
just does not look very good. The only requirements that it must meet
is that it must support annotations and horizontal case/switch statements.
Any other features, like GDOS support, are a plus.

Thanks...

Source record: 30284

Greetings....

Does anyone have, or have an ftp source for any ST hardware or
peripheral circuit diagrams in GIF or similar ?

Any info very gratefully received.

Jamie

In article <35qahq$epk@hasle.oslonett.no>, larserik@oslonett.no (Lars-Erik Oesterud) writes:
>I have a question about SCSI termination resistors (isn't that what
>they are called in english :-) on the MEGA STE (and in gerneral).

That's the right wording. :-)

>Somebody told me that a SCSI-cable should be terminated in both ends,
>but I have always been told that I have to remove them from the harddisk
>before installing it in my MEGA STE because the controller allready has
>a set of them. What is right - and what is most reliable (both works).

It is my understanding that the controller should be terminated (I use the ICD AdSCSI Plus, and it's terminated), and the drive "furthest" from the controller should be terminated, but any drive in between should not have any of the termination resistors.

I recently added a hard drive to my system. I now have two drives hooked up to an ICD AdSCSI Plus host adapter in an external case. The drive on the end of the SCSI cable is terminated, and the drive that connects in the middle of the cable has no termination resistors on it. This is apparantly correct (it certainly works!).

Hope this helps!

4950. Re: STZIP 26 BUG...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-22 10:39:40 UTC
From: vlefevre@ens-lyon.fr
Message-ID: <35rmtc$9qi@cri.ens-lyon.fr>
Source record: 30367

Has anyone seen the following bug?

If you ask STZIP to display a file (from the .ZIP file) and then want
to extract files, in general STZIP cannot read these files.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Is it possible to get the code (pref. in C) for a speech program anywhere?

Thanks for any help

4952. Assembler Graphics Help please

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-22 14:36:03 UTC
From: rrk@vixen.cc.bellcore.com
Message-ID: <35s4oj$msi@athos.cc.bellcore.com>
Source record: 30277
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

My assembler tutorial in ST Format tells me that a
32 by 32 pixel sprite requires 20 bytes in each line (low rez),
for 32 lines. I keep calculating 16 bytes (or 8 words) in each line,
not 20. I figure each of the first 16 pixels needs one bit in each
of four contiguous words (four planes for color). Similarly
I figure the next 16 (now 32 in all) pixels need four more
contiguous words. A total now of 8 words, or 16 bytes.
Could the fact they are using OCP Art Studio have something
to do with the need for 4 additional bytes? Or is there yet
another detail I'm neglecting?

Thanks.

From: zzptmsl@cguhpb.cgu.mcc.ac.uk
Message-ID: <35s7a6$lbu@yama.mcc.ac.uk>
Source record: 30278

I am having trouble connecting my MEGA to my Sony TV. I have tried
just about everything, including having a specific RGB lead made up.
The leads work on my STE, they also work on my MEGA using a friend's
PHILIPS scart tv. (the lead was made for a sony, however). If anyone
has any advive on the matter, I would be grateful if you could contact
me (Ian Pashley) by e-mail on:

pij@fs2.ee.umist.ac.uk

Thanks! :)

This depends on where the SCSI bus plugs into the computer or host adaptor.
For example, if one end of the bus plugs into the motherboard or
host adaptor somewhere, it is often terminated by that board in some way.
If the bus plugs in somewhere in the middle, then what you say is true.
Basically, a SCSI bus is a 50 line set of wires that is supposed to be
terminated on each end. I say "supposed to be" because this is primarily
to meet the SCSI length spec (which is, uh, 6 feet I think?). In other
words, if you follow the spec exactly, including termination, you should be
able to have a 6 foot SCSI bus. If it is shorter, then it might work just
fine without proper termination. For the bus lengths encountered in most
personal computer setups, just about anything will work in my experience,
as long as you don't have terminators in the middle of the chain.

Some examples:

XXX = External terminator HHH = host adaptor
DDD = SCSI device with no terminating resistors
DXD = SCSI device with terminating resistor packs installed
--- = SCSI bus (very often a 50 line ribbon cable)

XXX------DDD-------DDD--------HHH

This one could be a current Toad drive (I saw one recently), where the bus
plugs into the ICD internal host adaptor on one end, and goes to an external
plug with terminator installed on the other, with drive hookups in the
middle. I'm going to change my drive to this configuration soon, so I
can plug in Mac or PC external devices with ease, and without requiring
another host adaptor.

DXD------DDD-----HHH

This is what my drive looks like right now. One device with resistors
installed on one end, resistorless drive in the middle, host adaptor on
the other end.

DXD----HHH----DXD

Here is one with a terminated drives on each end.

DXD-----DDD-----DDD-----DDD----DDD-----DDD----DDD----HHH

This is what I want for Xmas. :-)

In general, I have found that termination is no big deal with my external ST SCSI stuff. My SCSI bus is about 2.5 feet long right now, and it does not seem to matter if the end is terminated or not. Now, terminators in the middle would certainly cause problems, but the lack of them does not seem to for me.

> AS you can see you should always have resistors in your ST, since this is always
> the beginning of your chain.

Hmmm, it sort of depends on how the internal MegaSTE SCSI/ASCI bus is organized. My guess would be that the internal and external bus are continuations of the same, in which case you would be right. It might also be the case that terminators on the motherboard itself need to be pulled to "connect" the internal and external ASCI bus, at which time proper termination on whatever is plugged into the external port would apply. The internal device would also be terminated in the scenario. I have not tried to put an internal drive in my MegaSTE, so I cannot speak from experience on that.

Cross-posted to: comp.sys.m68k,comp.sys.atari.st.tech

```
It seems to me that looking in a 128k look-up table for byte-swapping
would take longer than an 8-bit rol....

lea table.l,A0 ; get address of table into A0 (12)
move.w ???,D0 ; get data into D0 (4+)
add.w D0,D0 ; D0 * 2 (4)
move.w 0(A0,D0.w),D0 ; look in table and move into D0 (14)

--- 34+ cycles

versus

move.w ???,D0 ; get data into D0 (4+)
rol.w #8,D0 ; swap bytes (22)

--- 26+ cycles

Which is faster?

Definately the second one. PLUS, it is my understanding that the 68000
does fast byte-swaps when rol is told to shift by 8 bits, and the higher
processors have barrel shifters.

Using a look-up table is often a very good approach, but in this case,
definately not.

4958. SCSI problems - scanner killing HD...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-22 22:24:04 UTC
From: jonal@hiof.no
Message-ID: <jonal.2678.2E820404@hiof.no>
Source record: 30287

I recently bought a scanner (a Microtek ScanMaker IIs), but didn't connect it to my TT until last night. As long as the scanner is connected to the machine, the disk refuses to boot properly. The initial sequence runs fine until it is about to start the desktop, then it crashes with two bombs. It is unable to access the HD, yet I can access the scanner if programs are run from floppy. A friend of mine suggested that the scanner might draw some power from the SCSI bus and thus leaving me without enough power to fully support the internal HD. I recently added some more RAM, and it might be time to get a better power supply...

I have tried this with only the scanner attached to the external SCSI port, but it still crashes.

Any other theories?

Hi,

There was just an discussion about terminators on the SCSI chain. Looks like your setup is a perfect example of what can go wrong. You'll have to remove the terminator resistors from your internal drive. After that everything 'should' work (it work for me when I connected my external CD-rom to my TT).

Mickey, you are saying that you can use a car with three wheels only if you
drive small distances but you need all the wheels to make long distance trips.
I am sorry but your are wrong, the SCSI specs says that a SCSI bus must be
terminated at both ends, wether it is short or not. If you don't follow the
specs, it might work BUT the setup is not safe and you could lose datas.
Have a look at the Usenet group comp.periphs.scsi, they have a nice FAQ.
Bye.

I'm sorry, but I really didn't know these ROM images are copyrighted.
I've deleted the files (I _did_, believe me) and I'll ask the BBS I found the
files on to delete them.

Since almost every software I have is Public Domain / Shareware (I'm
using Sozobon C most of the time), I don't think about copyrights all day,
so thanks for telling me.

The problem is worse than that - I guess those resistors are gone a long time ago. I tried the setup this morning and the problem has changed a bit:

The machine boots, but when it gets to the desktop it bombs when in singletasking mode and AESSYS crashes under MTOS - then I get two bombs again when it tries to go single mode. This happens even if the scanner or other peripherals are disconnected from the TT. The only thing that works is booting from a floppy (bypassing AHDI) and mounting the drives. I haven't tried to fire up MTOS manually yet, but it might work.

The RAM is checked and every single bit seems to function properly, thus it can't be that power problem.

The only scanner related problem I have now is that the TT can't access the HD properly when it's connected. Perhaps I should put those resistors back on... :)

Grmf! This is really bothering me...

I'm a Notator Logic user and have been waiting for the Logic Audio (Direct to Disk Recording) for quite some time now. It has been released and I'm just awaiting delivery. Yesterday I spoke at some length with the distributor about updates etc. He informed me that E-Magic is sceptical of any further updates for the Hard disk recording module as E-Magic has apparantly found some discrepancies in the Falcon hardware itself. It would appear from what I understand, that the there are many different ways to put together a Falcon, and some of the ways may be incompatible with this particular software. Is there anyone who knows or might be able to offer a comment? I know that apparantly Cubase Audio is beautiful on the Falcon, although I've never seen it up and running!

Thanks.

Since what you're talking about is a sprite it is 20 bytes. If it had been
pure graphic it would take 16 bytes, but you need 4 bytes for a MASK to
get the sprite looking result.

This mask only need 1 bit/pxl (On/Off) so that's 32 pixels = 4 bytes.

No sir, I am saying that this particular car seems to run just as well with three wheels as with four, on Atari ST systems with fairly short SCSI buses at least (must be a Yugo). I don't recommend this practice, and in fact you will note that my drive subsystem diagram shows proper termination (and I would not have taken such pains to describe termination techniques). However, for an experimentor trying to acertain what is going on with a weird system, it is helpful to know that this _probably_ won't matter, hence my statement.

As for losing data, I think it likely that if (in a particular setup) an unterminated SCSI bus works fine, it will probably continue to work fine until the setup is physically changed. I have opened up ST drives owned by others that had been run for years with no problems and no termination. In fact, I have seen more problems caused by bad passive terminators (external ones) over the years than I have a lack of termination! On several occasions, I have found such bad terminators by pulling them, then rebooting the system. If it boots fine, I replace the terminator with an active one. Note that it booted fine for me to figure this out..... (this won't work with more than one daisy-chained external device, on say a typical Sun, BTW, probably due to bus length)

There are undoubtely cases where one can be "on the edge" of SCSI bus length that will work without termination, so I certainly don't recommend it! I'm just saying that it is not a black and white "written in stone" kind of thing, and could be thought of as such in the diagnostic process. Perhaps I should have made that clear. By all means, I advise following the SCSI spec concerning termination.

That said, I'll go take a peek at the FAQ you mention. All of my SCSI information comes from direct experience, not specs, so perhaps I should go see what I am missing :-).

4971. deskjet q's and med rez

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-23 14:58:29 UTC
From: mhsmith@ornews.intel.com
Message-ID: <35uqel$5qh@ornews.intel.com>
Source record: 30350

I have two questions:

Now that I've entered the wonderful world of color (after five years of mono) on my ST, I have a resolution questions.

I'm currently using a Mega STe with TOS 2.05. I can't figure out how to get the system to default to medium resolution at boot. I think this topic has been covered before, but now that it finally applies to me I'm interested in hearing some solutions.

Next question:

HP Deskjet 500 in parallel mode printing from GEM. First page prints fine, but second page prints three lines and form feeds. Where/how can I set page length from GEM so one full page prints on one physical page and I'm not always wasting one page after printing a full page. Does that make sense? I'm just looking for normal output as I would expect from printing out of Works. This seems to be a common problem in other applications as well. I've installed Gemspool and I see there are some options for doing manual FF's LF's and resetting the printer. But there don't appear to be any way of setting page length etc. Can someone shed some light on this mystery?

Thanks much,

Michael

Sounds like a terminator problem to me. TTs are rather complicated
with termination. AFAIK you need to add terminators inside your TT
(these are not supplied) and need to set terminator power to external
(i.e. provided by the TT) in any external SCSI devices.

BTW: but don't take my advice on this, as I still haven't managed to
properly connect the SCSI disk I bought more than a year ago :-)

Yes, it is 16 bytes long. If you use preshifting, you must keep 16 pixels more per line, which brings us to a total of 24 bytes/line, not 20. I really don't know why they reach 20.

MB.

: Randy Kutz Bellcore ..!bellcore!vixen!rrk
: or rrk@vixen.cc.bellcore.com

In my reckoning it should be 8 words. in 16 color mode on the ST.
4 planes (4 words = 16 pixels). Therefore 8 words = 32 pixels.
Maybe they meant 20 hex which is 32 in decimal!

I have written sprite routines for 16x16 and it was 4 words.

Need any more help just mail me.

I've hooked up an ICD Link host adapter with a SCSI streamer to my
MEGA STE, but can't get connected to it....

If I disconnect the internal MEGA STE harddisk the streamer appears at
ACSI ID 0. If I disconnect the ICD Link (with the streamer) the
internal harddisk appears as ACSI ID 0. BUT if both are connected
none of them work and ID-TEST only returns garbage as SCSI id-string.

To me it looks like both devices works on ACSI ID 0.
How do I get passed this problem (the ICD Link adapter is a closed
box with no DIPs or setting, and no special software). Is there
a strap inside the MEGA STE to set the first adress of the external
ACSI, or do I have to change the internal harddisk to ACSI ID 1
(the internal host adapter has adress select) - and if I do - will
the internal harddisk still be bootable (with the ICD disconnect too)

: The only scanner related problem I have now is that the TT can't access the
: HD properly when it's connected. Perhaps I should put those resistors back
: on... :)

: Grmf! This is really bothering me...

Yes but has the scanner got terminating resistors? If the scanner is
the last item on the chain it needs them, or you can get one of those
little external terminators and put that on the out socket of the
scanner.

Another thing to consider is terminating power. If the last device on
the chain is expecting to use TERMPWR to terminate the chain, or you are
using an external terminator pack at least one device on the chain
should provide terminating power.

Finally if you are using an external resitor pack then be carefull not
to use on of the Mac ones that were supposed to make mac scsi more
reliable. These are the wrong resitance. The one I stole of a Sun is
great though. I simply have no devices terminated and put the resistor
pack on the out socket of the last device whatever that may be.

Dave.

Hello! I also have a few problems with ACSI/SCSI on my Mega/STE.

Recently, I bought a Quantum ELS127S SCSI-II HD, since my old Seagate 48MB HD nearly was full. I wasn't able to connect the Quantum HD via the internal host adapter (seems to be a parity problem...), but when I borrowed an external host adapter from a friend (thanks, CG!), the setup worked fine.

The ID of my Quantum is set to 1 and the Seagate still has ID 0. The driver was placed on the Quantum using SCSI-tools. Now I can boot on my Quantum and choose if I want to use my Seagate or not, by only switching its power on/off...

If you can't alter the ID of the SCSI-streamer to 1, the remedy is to change the ID of your internal HD to 1, and install a new driver. With SCSI-tools, you can choose in what order the Atari will search for the ACSI/SCSI devices. I think that ICD Utilities has the same abilities...

Hope this helps!

>
>
>

To severely oversimplify things, electronicly what happens is without the terminations signals can reflect off the end of the cable. The electronic echos resulting can confuse the devices on the bus as the (weaker and weaker) echos repeatedly bounce back and forth, getting confused with new signals on the bus and other echos (just like you might get confused trying to listen to someone in a place with extreamly bad echos).

Placing a (correct value) termination resistor on EACH end of the line acts like an absorber, suppressing the echos without affecting the signals on the line between the two ends.

Placing the termination ANY place else will disturb the signals on the cable (adding its own reflections and absorbing some of the signal as it passes) distorting the signals and making it hard for devices on opposite sides of the incorrectly placed terminator to communicate (just like it would be if you tried to hear someone standing behind a partial sound deadening wall).

Its just like suppressing echos in a room: you place the sound deadening materials on the walls (ends of the cable), NOT between the orchastra and the audience (middle of the cable). :-)

As to what is the correct value and WHY it acts this way electronicly, I won't go into any details. The theory is much better covered in any good medium level electronics text than I could here, and in practice the correct value has already been computed for you and is provided in the "terminator assembly" that you buy already made. These analogys with sound (bad echos and absorbing sound deadening materials) should be adaquate for a reasonable "intuitive" understanding of the theory and effects.

Hi, I'm going to my first computer auction soon, and I imagine there will be all sorts of stuff there. I have a 520STFM (1Mb RAM) and wondered if there was any way I could build my own Ram upgrade ?

I'm pretty good with electronics, and was wondering if I just happened to see like '8Mb of RAM chips - $20', could I throw them into the ST (with an appropriate PCB of course !). Will any RAM chips work ? (I presume the answer is no, so what ones will ?)

Also....ANYONE got TOS roms higher than 1.2 (1.02) that they want to dispose of ? (leftovers from an upgrade perhaps ?) I have 1.2 and want to upgrade a bit, but can't afford the new 2.06.

Also, Also, is there a cheap DIY mod that I can do to stop my ST keyboard feeling like I'm typing on a bathroom sponge ?

Thanks.

Gentlemen,

thanks for all your suggestions for fixing my little problem. It got fixed
today during a chat with Erling Henanger - we tracked it down to something
as simple as a corrupted newdesk.inf file...

It was just the circumstances which made it look like a SCSI problem.

4987. Overscan problems!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-25 22:52:00 UTC
From: mikke.mattsson@tnogobl.ct.se
Message-ID: <a0cedf15@ct.se>
Source record: 30373

Hia!

I'm normally running the Overscan mod. on my Mega, but after installing Mag!x it doesn't run anymore. The reason for it not running is apparently that it doesn't recognise my TOS as 1.4 anymore.

I have the source for version 1.6 of the program, but it is garbled at the end, so it does not compile.

```
;-----------------------------------------------------;
; ;
; OVERSCAN.S Version 1.6 ;
; Bernd Gebauer ,Berlin 31.05.89 ;
; Karsten Isakovic,Berlin 07.07.89 ;
; ;
; RAMTOS 1.4 / BETATOS / ROMTOS 1.4 / BLITTER TOS ;
; ------------------------------------------------ ;
; ;
; GFA-Assembler 1.2 ;
; ;
;-----------------------------------------------------;
```

Does a newer version of this program exist, and if so, could someone please mail me the source so I can compile a working version. (If there isn't a newer version, then you just can send me a complete copy of this one)

Grtz.

Hi.

I am trying to find an algorithm to edit text - like in a text editor.

Are the starts of lines in text files indexed for speed, or does the program
just search thru the file looking for \n ???

Also, when text is inserted into the file, where do u put it? I mean -
surely it's too slow copying the lower half of the file down a character
each time you type.

Does any1 have an algorithm for this, or have any pointers that might help?

I'd much appreciate it,

Richard =8-]

Message-ID: <R.M.Morris.29.2E862094@massey.ac.nz>
Source record: 30370

How do I connect a SCSI hard drive to my ST?

I have a 20 meg SH204 (or whatever) and want to remove the drive inside for a (much) bigger one. I thought atari used scsi drives connected to the ASCI adaptor or something.

I don't want to have to send to the UK for an atari-ready drive as they cost a fortune!!!

I worked it out that buying a 100M scsi drive, would be the same as me buying a 540Mb drive here in NZ (big difference). And the atari bits seem a bit more expensive.

So can I just swap the drive from my SH204 or do I have to buy a host adaptor like the ICD one...

Any info would be most appreciated,
Richard =8-]

Try this:
```
MOVE.B (A0)+,3(A1)
MOVE.B (A0)+,2(A1)
MOVE.B (A0)+,1(A1)
MOVE.B (A0)+,(A1)
ADDQ.L #4,A1
```

Or this:
```
ADDQ.L #4,A1
@0 MOVE.B (A0)+,-(A1)
MOVE.B (A0)+,-(A1)
MOVE.B (A0)+,-(A1)
MOVE.B (A0)+,-(A1)
ADDQ.L #8,A1
loop to @0
```

BTW - For those of you still following this thread, I renamed it to more closely match recent suggestions.

In comp.sys.atari.st.tech Morris writes:

>I am trying to find an algorithm to edit text - like in a text editor.

>Does any1 have an algorithm for this, or have any pointers that might help?

The general idea is this: the text is stored in two parts, the
part before and the part after the cursor. In between is a 'gap'.
Whenever something is typed, it is inserted into the gap, so that
no memory needs to be moved or copied.

Data is only moved when the cursor is moved (i.e. some data is
moved from one side of the gap to the other).

I.e.

t_start ... t_gap_l <GAP> t_gap_r ... t_end

When the memory block gets too small, you'll have to reallocate.
't_end' always coincides with the end of the memory block.

For speed (at least that's what the Edith system does), you might
want to store a dynamically allocated block with pointers to
the start addresses of lines.

Depending on whether you are using the Mac paradigm, there might
be data inside the gap that is interesting, as a 'selection' is
then thought of as 'a cursor dragged over a piece of text'.
I would not encourage such an approach. The Mac paradigm is
outdated.

If your lines never exceed a certain length, an efficient
alternative may be to simply use an array of lines of equal
length, like the old Tempus editor did.

4996. TOS versions and changes info wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-26 17:50:07 UTC
From: hwl0978@gemini.tntech.edu
Message-ID: <1994Sep26.115007.3282@atlas.tntech.edu>
Source record: 30377

Is there some kind of FAQ or info file that explains the TOS versions and what some of the major changes to each version were?

Specifically, I am looking for info on such things and XBRA and cookie jars. I know that XBRA was added in 1.04, but not sure of its function. I also don't know when cookie jars were added and exactly what purpose they serve. It seems from what I have seen of the info in README files for various apps, these appear to be ways for programs to communicate with desk accesories and such sort of like pipes in Unix.

I put this in st.tech sincee it probably is really a programming concern.

Where can I get more info on these and other such enhancements to TOS and GEM?

The TT interface is a ECL type one.
This means that the electrical specs are different.
I'm not shure but you might even damage either VDU or computer
or even both if you connect them.

The dumb ICD software only works with their host adapters, but HuSHI
and HDDRIVER work fine with their hardware.

> I have tried this with only the scanner attached to the external SCSI
> port, but it still crashes.

It might be mismatched termination resistors.

OTOH it might be a clash between SSCI id numbers. If both the scanner and
the HD are set to the same SCSI ID, then this is liekly to cause problems.

Roland.

I must say I agree with this post. A lot is said about SCSI termination,
but I've mixed and matched drives on several Ataris and never had *any*
problems dure to termination.

Nobody is syaing this is *right* - just that it can and *does* work for
many people.

If you don't have an ICD AdSCSI, AdSCSI+, or Link2, you should try to ensure that the SCSI drive has a parity jumper. Some Quantum models do not (you have to do it in software, from something that can deal with parity). I believe these are the ELS models. If you do have one of those host adaptors, just about anything should work. Stay away from SCSI2 stuff that has other qualifiers, like fast, wide, double-ended, etc. Straight SCSI2 should work fine. Standard SCSI will almost always work fine. Just about anything that works on a Mac will work on an ST, given parity concerns.

Well, I suggest you purchase four 1mb SIMM or SIPP modules, and use them to upgrade your ST. I just did a 520STFM from 512k to 2mb, and it worked perfectly the first time. I am not a low-level hardware guy (this was my first project, in fact). Anyway, it is a piece of cake with SIMM/SIPPs. There is a set of instructions for using SIPPs on atari.archive.umich.edu in /Misc (2_5ramxxx.zoo, or something like that). I used these as a basis for my SIMM upgrade, which was even easier. I'll be writing up my humorous but successful experience and putting in the same directory soon. I took great pains to make this as easy for my underskilled self as possible.

Ha, this hardware stuff is easy :-).

Dealing with chip memory is probably cheaper, but also probably much more work, unless you buy a premade memory upgrade board.

> Also, Also, is there a cheap DIY mod that I can do to stop my ST keyboard
> feeling like I'm typing on a bathroom sponge ?

There is a spring set that will make it feel stiffer (the name escapes me). Also, there are hardware interfaces to let you use a PC keyboard (DEKA is the name, I think). You want one that is hardware only, so it will work with any games and such as well (there are some that depend on a software driver, which means you will have to type on the old keyboard with self-booting stuff).

I have gone through at least a dozen versions of the ICD software, and did not have to pay anything for them (perhaps a bit of shipping for the disk, but nothing major). IMHO, that level of support is worth far more that what I paid for the hardware. That is not to say that the other products you mention are not also good (I have not seen them), but I would certainly not characterize the ICD upgrade policy as "dumb". In fact, it is one of the smartest I have encountered! I wish more companies would give that kind of support.

What you need to realize is that the versions of the ICD software that are restricted are free upgrades for ICD hardware owners, not just "generic" software. If I did not have an ICD host adaptor (or if I was using a Falcon/TT), I would buy the Pro level stuff in a second (which works on just about any host adaptor). Their software (and hardware) is tops, IMHO.

Actually, I have 2 MFM hard drives hooked up to my 1040STe with an Adaptek
4000 conversion board. I use a Supra host (SCSI) adaptor by the way. MFM
drives are really cheap these days.

>
> I don't want to have to send to the UK for an atari-ready drive as they cost
> a fortune!!!

The SH204 consists of a ACSI to SCSI host adapter, an Adaptec 4000A
SCSI to ST506 controller, and a ST506 drive. Swap the drive for a SCSI
drive, ignore the Adaptec controller, and you're set. In the earlier
days (when 20 MB were just a little too small, and something like 80 MB
seemed huge), this was a pretty common way to upgrade the SH204.

The software part, however, could be trickier. I hear that the more
current HDX versions do no longer support the SH204 drive. Other software
may have problems with the SH204's PAL bug in the host adapter.

5012. [HELP] Sound Programming on Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-27 13:10:34 UTC
From: jhh@cwi.nl
Message-ID: <CwsHxM.DLw@cwi.nl>
Source record: 30390

Hi,

I just got the Atari Compendium, and wanted to do some simple sound programming on my Falcon: just playing a sample by DMA using the XBIOS calls. Now the Compendium looks like a nice book, and seems to document each individual function adequately, but it doesn't give much background information on how to use them in conjunction with other function. To be more specific
- I figured I have to use Devconnect() to connect the DMA to the output, and set the sampling rate. So far so good.
- I, off course, have to check the cookie jar for availability of these functions first, and lock/unlock the sound system before and after use.
- the buffer with data is set with Setbuffer()?
But now the trouble begins:
- how do i start playing the sample? Do I use Bufoper()? What's Bufptr() got to with the operation of Bufoper() (the compendium says I have to use Bufptr() first, but I don't see how)
- the function Settracks() indicates that it is possible to play back 1-4 tracks simultaneously. But how do I tell the sound systems which data comprise which track (Setbuffer() accepts only one buffer).
- the function Settracks() indicates also that it is possible to _record_ four tracks simultaneously. How do I determine the source for each individual track? Where does the data go
- the function Setmode() changes the type of sample data from 8bit/16bit or mono/stereo. How is the data for each mode represented in memory?
- the function Soundcmd() mentions the existence of an 'adder'; which are its inputs and where (if at all) does it connect to the sound-matrix.
So what I really would like to know: what's the 'official' way to play one or tracks through the DMA using XBIOS calls.

P.S. Functions names may be slightly incorrect because I'm typing them from memory.

Thanks in advance for any help I may get (please mail replies to me: I'll summarize)

You didn't mention the Libs you are using. This sounds like
one of these pre30 lib errors.

Get MiNTLib >30 (39 and 44 are ok, don't use 45).
This may solve your problem.

BTW I had no probem compiling MiNT with GCC 2.4.2 till last week.
It didn't like the 1.11h2 source, that's why I'm on 2.4.5 now.

Stay away from GCC 2.5.x for x!=8.
2.5.8 is said to be ok.

5015. Problems with slip

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-27 19:06:45 UTC
From: David L Watson <dw4g+@andrew.cmu.edu>
Message-ID: <8iW6p5600WB88IQUVj@andrew.cmu.edu>
Source record: 30193

It turns out my previous problem trying to install slip using MiNT
was caused by my forgetting to place the slip driver in my mint
directory.
Now, when I run slip it seems to mess up all other network stuff.
For instance, before I run slattach, ping works fine on the localhost.
After I run slattach ping localhost just sits there. I have no idea
what's causing this so if anybody can give me ideas where to start
looking for problems, I'd appreciate it.

David

5016. non-Motorolla processor

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-27 19:38:05 UTC
From: mhsmith@ornews.intel.com
Message-ID: <369sat$sei@ornews.intel.com>
Source record: 30199

I find this quite bizarre, but:

As I was putting a new power supply in my Mega STe, I couldn't help
but notice the processor was NOT a Motorola. It was labeled ST,
which should be SGS-Thompson. very uncool

Now can someone, maybe even a design engineer from Atari tell me:

Was the Mega STe designed around a non-Motorola processor?
Could the compatibility problems people experience with Mega STe's be related
to, not just the TOS version, but possibly using this "foreign"
microprocessor.

Working for INtel, you would think this wouldn't bother me, but
I think when a system is designed around a particular processor,
then it should ship with that processor. There is no such
thing as a perfect clone..unless Motorola released the microcode
for their 68000 processor to third party IC manufacturers and
they're licensed to build this chip.

Can anyone tell us if putting the Motorola 68000 in the MegaSTe will
make a noticeable difference in performance/compatibility?

Thank you,

Michael Smith

>hopper_t@msupa.pa.msu.edu

Sorry Tom, I already sent the mail, perhaps Richard will forward my reply.

Basically, here is the answer ->

```
struct line {
char * text;
size_t lnsize;
struct line * next;
}
```

Every line is just a null-terminated C string, with lnsize bytes of
storage (allocate at least 81 bytes for each new line, and realloc() as
needed). Each line structure has a pointer to the next line. Now,
an insert is an insertion into the linked list, a delete is an unlink
and free(text) and free(liststruct) - use a temp pointer or the ->next->next
method to unlink.

Moving blocks just unlinks the structures and re-links them elsewhere!
No data moving.

There are, of course, other methods, but if you are used to basic, and the
idea that everything is an array, and you aren't used to dynamic memory
allocation, then your SOL.

Hmm .. I think that covered everything. Richard won't need to forward my
reply after all :-)

CYA,
Evan Langlois

5019. Need help trying to replace Atari mouse

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-27 20:39:39 UTC
From: mah@mpr.ca
Message-ID: <1994Sep27.203939.24502@mprgate.mpr.ca>
Source record: 30195

A friend of mine owns an ATARI 1040ST. He is having serious problems using his mouse (Atari STMI) - it only works intermittently so it must be a loose connection. He finally found a store which sells Atari stuff and was told that a new mouse is $60 (Canadian). Considering the current value of his 1040, he wasn't too thrilled about shelling out this amount of money.

Two questions:
- are there any third party mice for Ataris which are significantly cheaper than the above, and, if so, where can he find them?
- I noticed that the mouse uses the same connector type as serial mice for IBM-PC compatibles, i.e. 9-pin (DB-9?). Is it possible to use a IBM-compatible serial mouse with the 1040 or can it be adapted/rewired?

Thanks in advance for any help.

Richard Mah

> I have a 20 meg SH204 (or whatever) and want to remove the drive inside
> for a (much) bigger one. I thought atari used scsi drives connected
> to the ASCI adaptor or something.

Unless you are very lucky, you will find that the SH204 *doesn't* have a SCSI drive. Its more likely to be an MFM or RLL mechanism.

Have a look in the case and find the drive model number. Also look at the cables. SCSI has 1 50way ribbon cable. ST506 interfaces (as used by RLL and MFM) have 2 smaller cables.

Either way, you should be able to find some sort of drive which is bigger than the one you already have.

:-)

I am not sure if this made it out to the Net the first time I tried to post. If it did, forgive me.

Has anyone successfully used Setinterrupt() with Timer A on a Falcon 030? If so, please point me in the right direction (or send me) some example source code.

Thanks.

where is the problem??
Hitachi and SGS (also some other's I cant remeber) have the license to
produce 68000.

>Was the Mega STe designed around a non-Motorola processor?
no. The Hitachi and others are working fine.

>Working for INtel, you would think this wouldn't bother me, but
>I think when a system is designed around a particular processor,
>then it should ship with that processor.
The differences between the Moto 68000 and the other manufactured 68000 are
very small, it's not like Intel 486 and AMD 486!!!!

>There is no such
>thing as a perfect clone..unless Motorola released the microcode
>for their 68000 processor to third party IC manufacturers and
>they're licensed to build this chip.
They are licensed, because Moto is not as braindead as Intel...

> - how do i start playing the sample? Do I use Bufoper()? What's Bufptr()
> got to with the operation of Bufoper() (the compendium says I have
> to use Bufptr() first, but I don't see how)
You're right. Buffoper() starts the sample. Just set the bit for play.
If the volume is to low use soundcmd() to adjust input and output volume.

> - the function Settracks() indicates that it is possible to play back 1-4
> tracks simultaneously. But how do I tell the sound systems which data
> comprise which track (Setbuffer() accepts only one buffer).
You have only one sample buffer on the falcon. The samples are intereaved like
this: left side 1. Track, right side 1. Track, left side 2. Track, r. side 2. Tr.
etc.
> - the function Settracks() indicates also that it is possible to _record_ four
> tracks simultaneously. How do I determine the source for each
> individual track? Where does the data go
The source is always the same (set by devconnect()), you just have 8 channels
from one source to one destination.
> - the function Setmode() changes the type of sample data from 8bit/16bit or
> mono/stereo. How is the data for each mode represented in memory?
Hmm. Never jused anything else than 16 bit, but if I remember right you can
only record in 16-Bit mode. 16-Bit mode is also always stereo. The 8 bit mode
takes one byte in mono and two bytes in stereo but maybe the buffer length has
to be a multiple of 2 or 4 Bytes 'couse of the normaly used 16-Bit stereo mode.

> - the function Soundcmd() mentions the existence of an 'adder'; which are its
> inputs and where (if at all) does it connect to the sound-matrix.
The hardware adder adds the input signal (ADC) to the output (DAC). This might
be usefull in some kind of applikations.
> So what I really would like to know: what's the 'official' way to play one or
> tracks through the DMA using XBIOS calls.
I try to remember (I'm kot sitting on my falcon just on a Unix machine):
- locksnd() - with the right return code (128 ?)
- soundcmd() - set the I/O, the adder etc. as you need it
- setbuffer() - set the playback buffer
- setmode() - set the mode (e.g. 16-Bit stereo)
- settrack() - in most cases one track mode
- setmontrack - set the track which shall be put through the DAC --> headphone output
- devconnect() - set the matrix as you need it
- buffoper() - start playing the sample

I think that's it.
Hope this helps.
If not email me and I'll give you more help.

Depends on the number of harddisks connected to the hostadaptor. HDDriver supports LUN 0 and LUN 1, but AFAIK at least some of the ICD hostadaptors will allow more than two devices. Those who have more than two harddisks connected to the same ICD hostadaptor will be stuck with the incompatible ICD software.

>with this particular software. Is there anyone who knows or might be able
>to offer a comment? I know that apparantly Cubase Audio is beautiful on
>the Falcon, although I've never seen it up and running!

I have Cubase Audio Falcon v2.0 and can confirm that it works very
well indeed, but as I understand it from the 'New features in version 2'
section of the manual, there was a 'SCSI Timeout especially during
long recordings' problem which was fixed in v2.0, and the text goes on
to say that 'this was actually a Falcon hardware problem, but could
fortunately be solved in software'.

Perhaps this is a similar problem to which E-magic refer, but in
addition to this there is a 'modification' to the CPU clock signal
which I understand is 'recommended'. I have this mod fitted to my
machine, so am not sure whether this particular mod is absolutely
necessary - apparantly on some machines it was possible to get a
disturbance on the SDMA clock signal resulting in cracking noises
on the audio.

I read a transcript a while back in 'Atari Explorer Online' of
(I think) the final 'Atari Round Table' on Genie, in which it was
mentioned that Atari were thinking about the possibility of developing
a 'music workstation', and have since heard that 'Falcon technology
has been licenced to C-Lab GmbH' - perhaps a Falcon-based music
workstation integrated with C-Lab software is planned, but I thought
'E-Magic' was actually 'C-Lab' previously.

Yes after have brought some German software, I find now there is no longer
any English support for these programs....

1. Script V1.0, only has a USA Dictionary, now up to version 3.5,
but only if you are German...

2. Auto Overscan, no later English version than 3.0zi, I have been told that I
need version 3.0zm for multitasking, but there is no English version..

3. Tempus 2.07, the very first program to be ported to English, now version
2.21, but only if you are German...

4. Signum 2, now upto version 3, but again only if you are German...

5. Papyrus, no English Dictionary or Thesaurus as of yet....

6. Tempus Word/Light, no English version..

7. Pheonix, no English version..

Why the BIG no support for English users of most of these programs..??

The only piece of German software that I have had good support is GSZRZ,
and you can update it via a BBS....

I am still waiting to get support for Auto Overscan, all I have been given is
the run around from the UK and zero Internet help from the Germany....

So what is going on in Germany, ??? are they going bankrupt..??

Please Please support your users, you have the Arari community at your feet...

Richard,

Your friend can purchase a BeetleMouse through mail order places such as
Toad Computers or retail such as Vision Computers in Eugene, OR (my
favorite).

A MS compatible mouse can be used. Instructions for converting the MS
mouse are contained on some of the ftp sites and local BBS's.
Plugging an MS mouse directly into the ST is a really bad idea.. I
don't recommend it unless you have a fire extinguisher handy.. :)

The instruction's I've seen are for the bus mouse version of the
MS mouse, though the serial version can be converted as well. I
don't know the pinouts or routing off the top of my head.. maybe someone
can post an ASCII routing??

Hi Roger!
In comp.sys.atari.st you write:

>Yes after have brought some German software, I find now there is no longer
>any English support for these programs....
[...]

>I am still waiting to get support for Auto Overscan, all I have been given is
>the run around from the UK and zero Internet help from the Germany....
-
Most German developers are not connected to the internet. The
German "Maus" (<-german word for 'mouse' it's a nationwide net of
local BBS] is very popular instead.
(about as 10-20x more postings than on the usenet.)

I've just forwarded your article to the Mausnet, so hopefully you
will get some mails (or even support) from Germany.

>So what is going on in Germany, ??? are they going bankrupt..??
-
I don't hope so!
Some developers recently said the market is regaining from
conciousness ;)

I hope you'll get some answers!

bye -thommy

BTW: What does BBS mean :-?
P.S. sorry for any mistakes, but here's no spellchecker and no
dictionary...

While Motorola HAS licensed a select few other chip makers to make clone processors (I don't have first-hand knowledge of such, but I understand that to be the case), ALL Atari TOS-based machines SHOULD have genuine Motorola CPUs in them. If you ARE correct about having a non-Motorola 68000 in your machine, that is a highly rare occurance and has very little (if ANYTHING) to do with any incompatibility problems. The incompatibilities are due to changes in TOS and new hardware (a 16MHz CPU, cache, new sound hardware, VMEbus, etc.).

No, you cannot use 9-pin serial mice with the ST's mouse/joystick
port. There IS software available (from Cybercube Research, I
think) that will let you use serial mice in the ST's serial port,
though. Mice that are compatible with, I believe, the Microsoft
mouse (bus/mouseport version) are supposedly capable of being
rewired to work on an ST's standard mouse/joystick port. I'm
looking for that information myself!

What exactly do you mean? HDDRIVER supports 8 SCSI devices (7 in Bus
Arbitration mode because TT or Falcon in this case have a SCSI-ID of their
own) and two logical units for each device. This is independent of the host
adapter you're using.

I want to make up a serail cable to go between my STe and a PC (with a "small" serial port).

Could someone mail me the pin connections etc... as all my books are at home!

Many thanks.

Steve.

The ICD host adapter software is the most widly used in the world, and NOTE:
the most compatible, if you have a gripe with ICD please send them a e-mail,
and don't slander them over the net Thanks...

There is very little support for German software out side Germany...

Please ask me about the UK support for Overscan...

I don't think that XBRA was a TOS thing at all, but a software standard,
but the COOKIE JARS thing was started with TOS 1.04, but not fully compatible
till TOS 1.6...

COOKIE JARS tell other programs what othere programs are resident and what
options that are fitted to the machine, ie, hardware and software..

XBRA is the correct way to steel vectors, thats from memory...

Does anybody know how to add information to the rom so that I could personalise the windows and desktop. At the moment I draw new routines from GFA Basic. If I could do it through a cartridge it would be best so I don't have to have a permanent change. Also how could I do it using GFA Basic. I could compile it then load it into an assembler for any changes to the way the program goes in memory. Thanks for any help.
Will.

5046. Serial Port

Newsgroup: comp.sys.atari.st.tech

From: simonh@perth.DIALix.oz.au
Message-ID: <36eflu$89r$1@perth.dialix.oz.au>
Source record: 30230

I've read a few articles lately on HSMODEM2, and they all mention a mod for the ST serial port that allows it to go up to 38400 baud.

I've got an Ste with the T28 accelerator in it, and I use a 9600 baud modem, and often tranfer files to a PC in the same room which has Gemulator on it. (I don't use floppies - we transfer mb's at a time.) Being able to access higher baud rates would be very useful.

Does anyone know of a doc file outlining the mod, or know where I can FTP the info from?

Thanks for any help

Simon Haynes

P.S. Has anyone modified their ST's serial port & if so, does it work?

Simonh@perth.dialix.oz.au

>about any host adaptor). Their software (and hardware) is tops, IMHO.

Agreed. The ICD software may not comply with AHDI/XHDI, but it's got a heck
of a lot more 'built-in' features. With ICD, you don't need to clutter
your AUTO folder with cache programs, clock programs or FOLDRXXX.PRG.

I'm sticking to ICD, despite being the original poster on this thread.
The problem was a bug in MinixFs when using partitions > ~250meg. Now
that it's fixed, it works a treat. (Well, almost. It crashes with filenames
longer than 16 characters....)

Cheers, Steve

Here you go. This is both the instructions for converting a Microsoft Mouse (bus version) and an Amiga mouse to ST use. My understanding is that the Amiga one requires no soldering/cutting, just moving a couple of plugs inside the mouse.

If anyone runs into a pile of the old Microsoft mice, I sure would like one :-). I have been on the lookout for such a unit in various computer graveyards for years, but have not found one yet.

--begin microsoft hunk--

Date: 21 Feb 89 03:02:45 GMT
From: tektronix!ozvax!tekcsc!jeff@ucbvax.Berkeley.EDU (Jeff Beadles)
Subject: Here's how to hook a MicroSoft Mouse to a ST
To: info-atari16@score.stanford.edu

Well, here is how to connect a Microsoft Mouse to an Atari ST. (520/1040) The Atari has a 9-pin D-type connector. The Microsoft Mouse has a rather strange connector on the end. To prevent having to cut the mouse cable up, I made this adaptor. If you still can't follow it, please let me know and I'll try to redescribe it. This does work for me. I've been using it for 6 or so months now with no problems at all. It does take some soldering skills, so if you're not so hot at soldering, find a friend to help.

As far as I know, this does not effect your Atari's warranty. However, I have not asked Atari. :-)

Atari ST	Microsoft Mouse	ST expected signal
1	5	XB
2	3	XA
3	8	YA
4	9	YB
5	N/C	N/C
6	2	Left button
7	N/C	+5VDC (N/C)
8*	6 and also tie to pin 1	Ground
9	7	Right button

* = I am not sure why I have pins 6 & 1 tied together, but it does work.

The Microsoft mouse connector looks like this. This is the solder side,
with the leads pointing up.

```
---------------
| 1 |
| 2 3 4 5 |
| 6 7 8 9 10 |
| |
---------------
```

If you can not use the connector, the pins are numbered as follows. This
is the connector side from the Microsoft Mouse plug:

```
/------------\ This is a view at the front of the connector.
/ Blank "KEY" \ It is where the plug from the mouse would be.
/----------------\ The pin labeled 'n' is not connected.
| n 4 X 8 | The place labeled 'X' is filled, and does not
| 9 7 1 2 | have a pin.
| 5 6 |
\ /
\------------/
```

Have fun!

Jeff

>From: BGB100@PSUVM.BITNET (Bruce Blanar)
Newsgroups: comp.sys.atari.st
Subject: Commodore Amiga mouse->ST
Date: 28 Nov 89 02:33:25 GMT
Organization: Penn State University
Posted: Mon Nov 27 21:33:25 1989

Below is a decription of the mod need to be made to a Commodore Amiga mouse
to get the mouse to work on an Atari ST. The Amiga mouse offers a faster
(slightly) tracking rate and two very comfortable buttons to use. The
mod is easy to do and provides a very nice mouse. Enjoy!

Commodore Amiga mouse -------> Atari ST mouse

This is the mod for a Commodore Amiga mouse conversion to ST mouse. No
big deal about the difficulty of the conversion, but still be careful
about what you do. I have included the original wire order by color so
that if you do mess something up, it is here. If the wires in your

mouse are different colors, I suggest writing down the color order before starting in case you switch the wrong wires. Then you can go back to START and begin again.

OK...here it is. All it involves is switching two wires on the connector going to the mouse circuit board. I'll give the before and after views e of the connector wires in order from back to front (of the mouse).

```
Before To use on an Atari ST
--------- -----------------------
Black Black
Blue Blue That's it!
Brown -----\ /-------- Yellow
Orange \/ Orange
White /\ White
Yellow -----/ \-------- Brown
Red Red
Grey Grey
```

Like I said, the mod is not difficult. The standard disclaimer applies. I cannot take responsibility for any misfortunes that may befall you because of your using these plans for the mod. I have performed this mod and I know it works. I ripped the whole mouse apart trying to figure it out before I found out I just had to switch two wires. If you need help with the mod, ask someone you know who has the expertise to do it.

Good luck!

Bruce Blanar

>So can someone help me get it running or can someone help me find a

The 'Falcon' version of Cubase is v3.02, and runs fine on the Falcon.
I obtained v3.02 free of charge from my supplier (Harman Audio here
in the UK) in response to a telephone call (v3.02 uses the same
dongle as v3.0, which I had been using with my 1040ST).
I'm not sure what the position would be if you are currently running
a lower version than v3.0, but perhaps it would be an idea to contact
your supplier - I am sorry I can't offer any pointers regarding an
alternative Falcon sequencer from an ftp site as I do not know of any
specifically for the Falcon, perhaps someone else can help here.

Source code for various vi clones and MicroEMACS (and a zillion other
text editors) is available all over the 'net...

> Are the starts of lines in text files indexed for speed, or does the program
> just search thru the file looking for \n ???
>
> Also, when text is inserted into the file, where do u put it? I mean -
> surely it's too slow copying the lower half of the file down a character
> each time you type.

Well, if I were writing a plain text editor, I'd probably just keep a
linked-list of lines. Then, when the use types in a new letter in the
middle of the line, you just move over the rest of the characters, all
of the other lines are untouched. I'd probably make it a
doubly-linked-list, just to make adding/deleting lines easier.

Now, if I were writing a word processor, I'd use a linked-list of
paragraphs where each paragraph was a linked-list instead of just an
array of characters. The linked-list that made up the paragraph would
store format info (font, size, bold/italic/underline/etc) and the array
of characters.

Of course, I'd do this all in C++, where it'd be pretty easy; complex
data structures are tricky in C due to the pointer semantics... it's
easier in C++, since there are references.

Hi together.
A friend of mine has bought a so called "Professional Scanner II"
for an atari st. This device is to be plugged into the romport
of the st. Unfortunately, there was no cable in the package and
since he bought it at a liqudation (right word?) of a firm,
he has no way of getting the original cable. We tried
to phone the manufactorer of that device, but it failed up to know.

Finally the question: Does anybody know of cable between this
scanner and the st? Which Pins of the romport have to be
soldered to which pins on the subd-25 pin on the scanner?
Is it only a cable or an interface? If interface, how to build it?

The scanner: "Professional Scanner II"
from "Print-Technik in munich and vienna"

Questions over questions, any help would be great.
Answers preferred by e-mail.

ciao, Christian

Sorry, english is not my native language and i never hacked on an atari...

A follow on to my previous post, The Atari Compendium covers TOS 1.0
through TOS 5.0, MultiTOS, and Falcon030. It has 860 pages. ISBN:
0-9638331-0-3. The $49.95 is a suggested retail price. may be available
through your local dealer or the source is :
Software Development Systems, 996 Redondo Ave. #404,
Long Beach, CA 90804 (310)430-0364.
Please note: I have NO connection with this company. I have a friend who
purchased this book to solve his programming problems and in spite of the
steep price he said it was well worth it.

David

Most compatible? Good joke. It isn't even compatible to the official AHDI
3.00 releate notes dated Aug. 1989.
If you don't believe this take a look at these notes.

>
>Two questions:
>- are there any third party mice for Ataris which are significantly
> cheaper than the above, and, if so, where can he find them?

Third party mice can be purchased via mail order from many dealers that
sell Atari computers. For Example: Toad Computers has Toad Swifty mouse
for $29, Toad Optical mouse or a Toad Trackball for $49. Order #
(800)448-8623
ATY Computer has a High Rez mouse or a Pen Mouse for $39, three button
trackball $69. They also have TT Touch (for Keyboard) at $29.
(510)482-3775
Vision Computers @ (503)485-1424 caries everything that Toad has in their
catalog and generally at a lower cost.
Computer Rock is another possible source @ (415)751-8573.

One of these sources should help with your mouse problem. Your friend
may save many dollars to try cleaning his mouse if the intermittent
operation has to do with the cursor movement (see your atari users manual
under cleaning). if it is the mouse buttons, than it may be the
micro-switches. If so replacement switches can be obtained from Best
Electronics in the San Francisco area. Sorry, I don't have their # handy.

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

Just a request here on behalf of many who slog their way through the
Atari newsgroups every day on the Usenet and other online services:

PLEASE... when you post a message to ANY newsgroup on the Usenet, keep
your messages to a width of 80 columns or less and use a hard carriage
return at the end of each line. That means no lines longer than this:

0--------1---------2---------3---------4---------5---------6---------7--------8

A lot of folks have been merrily typing away, entering a huge post and
never pressing the RETURN key. This has an adverse effect in two ways:

1) It makes your post extremely hard to read from most newsreaders and
impossible to read from some of them (and doesn't reflect very well
on you as the sender, either);

and

2) It makes your post a likely candidate for being deleted from the
queue of those posts that get echoed (relayed) to other online
telecomm services. No one wants to manually clean up such posts so
the simple solution is to just delete them. Zap!

Remember, not all newsreaders are created equal. So be thoughtful and
take just a moment to properly format your posts. And would it be too
much to ask folks to stop using those darn HUGE sigs? Yeh, thought so. :)

Cheers,

-Hutch- @ Fair Dinkum Tech

5064. Multi-player games before 1983?

Newsgroup: comp.sys.atari.st.tech

From: kowalski@access.digex.net
Message-ID: <36h63q$cn7@news1.digex.net>
Source record: 30142

I am doing research on the history of video games and am curious to find if anyone knows of multi-player games that existed before 1983.

The game should allow two players to play each other in a way where the two players are not looking at the same screen, but they may see the other player on their screen. They may be connected through modem, over network, or whatever...

Any clues?

5066. Problem: Conner HD with ICD Micro

Newsgroup: comp.sys.atari.st.tech
Date: 1994-09-30 22:43:56 UTC
From: paul@vega.ame.arizona.edu
Message-ID: <36i4bc$5d9@news.CCIT.Arizona.EDU>
Source record: 30145

I just bought a 540M Conner hard drive (CFA540S) to replace the original 50M one in my TT. Hooked up the the TT SCSI, it works just fine (and much faster than my old one).

But, as I use Spectre 3.0, which does not recognize the SCSI port, I've had my old hard drive hooked up to the external DMA port via an ICD Micro host adapter. However, the adapter and my new drive can't seem to communicate, as I can get no response when they're together. The sparce documentation with the drive says that parity is always enabled. Is that all right? Or maybe the host adapter isn't getting power correctly, though that would seem odd.

Has any one else had any problems with such a combination? I'd apreciate any help. (And to Dave Small, if you're listening, I've been waiting for Spectre 3.1, which should fix this problem, for about three years now....;)

How does the following compare with the above :

move.b (a1)+,(a6)+
move.b (a1)+,(a6)+
move.w -(a6),-(a1)

Assuming a6 points to a word of free storage (or some stack or whatever),
and a1 points to the value you want to swap. I'm not sure which is faster,
since I can't my tables on effective address calculations.

Anyone know for sure?

>

I realy must agree with you: ICD is not to compatible. And their hardware
is so-so.... At least one of their ACSI->SCSI converters vil block the
floppy drive(s) if you use anything but ICD's own software.
I've come across at least one setup with a TT (with a LOT of extra goodies
on the acsi and scsi bus) where the ICD driver created extensive problems.
The solution was to boot with ICD driver when they needed to use the
ICD tape streamer. Also they had to disconect the ACSI->SCSI board when
not using the ICD driver.
One might wonder why they didn't run the streamer on the SCSI bus, and
the reason was simple: The (ICD) software had no suport for TT-SCSI, and
in fact the TWO first versions they got didn't work at all on the TT!!

They were certainly not to impresed by ICD. And after a few clashes (sp?)
with ICD trying to get some suport to solve these problems, they finaly
gave it up, and opted for a network solution, and connected their TT to a
PC/MAC network (NOVEL/Ethernet) where they easily can do their backup on
one of several streamers!

If you want to install other drivers than the ICD one bootable on your hard disk this only works if your drive is partitioned according to Atari standards, i. e. with not more than 4 primary partitions on the root sector of your hard disks. When a drive was partitioned using the ICD software it is likely that the partition scheme is not Atari compatible.
With Atari compatible partition schemes you can use any hard disk driver I know without reformatting or repartitioning your drive.

My Conner CP30100 drive has the parity bit always set (it is not possible to
switch it off) so I had to buy an AdSCSI PLUS from ICD (which supports parity)
Unless your drive is newer than mine and that Conner changed this stupid
"feature" (the parity always enabled), you can not use the ICD micro adapter.
Sorry.

I Wouldn't buy any of the items you listed, for use with ST.

However, you _may_ find a use for the following:

>Lion 611B external SCSI case for SCSI devices

You will need a host adaptor, eg ICD Link, and SCSI hard disk to fit the case.

>Lion 3400 external CD-ROM case with PSU & SCSI cables

You will need a host adaptor, eg ICD Link, and CD ROM drive to fit the case.

I have seen brand new cased CD300 CD ROM drives for £107 plus VAT.

Good luck.

Yes, this connector is the cartridge port, into which you plug a cartridge,
with your programs on ROM, up to 128K bytes.

Some companies including, IIRC, Steinberg, use this port for a dongle.

Your example does nothing - it writes back the same bytes in the same
order as they were before.

(BTW - your attribution is wrong. I didn't write the fragment with the
rol's and swap - I quoted it from someone else.)

> The differences between the Moto 68000 and the other manufactured 68000
> are very small, it's not like Intel 486 and AMD 486!!!!

Just to put things in perspective.

Those of you who remember the Sinclair ZX Spectrum might know that it was built around a Zilog Z80. However if you opened one up, the chances of there being a Zilog chip inside were very small. All the ones I saw had NEC chips.

Apparently Zilog had licensed the chip to NEC, and the NEC version was more plentiful.

While I'm at it. Olivetti did a 20Mhz 286 based machine - the M290-30 several years ago. I've had over 100 of these apart and *never* found an INTEL 80286 inside! The've always been AMD or HARRIS ones. AFAIK INTEL never made a 20MHZ 286, so other manufacturers ones were use. Never stopped the machines running any PC software though.

:-)

Roland.

Hi everybody!

i want to connect a second SCSI drive to my atari megafile 44
(Syquest 555). There's a second connector and a second power
supply on the atari host adapter, but it doesn't recognize a
drive over the second connector. Does anybody know, what to do,
to have two drives running with the original atari hostadapter
from the megafile 44 drive?

Any hints are appreciated!

Many thanks in forward.

HT> circuit for this?

Beg pardon, Hallvard, but if you've got an STe, why are you wanting to install a speaker INSIDE it when you've got a pair of audio out jacks that you can attach to outboard self-powered speakers, or even a stereo system you could get for cheap at a garage sale? You'll get better sound that way, AND in stereo!

Ummm you forgot the branch instruction

forever
move.b (a1)+,(a6)+
move.b (a1)+,(a6)+
move.w -(a6),-(a1)
bra forever

...Definitely the slowest byte swap- 1 word swapped in infinite time.

5084. HS Modem

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-03 00:51:41 UTC
From: kfason@csn.org
Message-ID: <Cx2nq5.4DH@csn.org>
Source record: 30166
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

A friend and me are trying to get something figured out. He has a Mega/STe, he also has RATsoft BBS running with a USR v.34 modem. It works fine on Modem1 @ 19200, but since the modem can do 28800 he wants it to be locked @ 38400 or preferbly 57600. We played with HS Modem a little. WHile RATsoft sees the modem on modem2 with no probs, the Modem2 does not have a ring indicator. But with playing HSModem, I read in the docs (MFP_X.TXT) that you could get 57600 on a 8Mhz or 16Mhz 68000 CPU on Modem1. It then has something untranslated under it, so I assume that is the method... How do I get HSModem to redirect the Modem1 to go past 19200?

We tried configuring it, but with the english being poor we could not figure it out too well. but we setup MFP.PRG like this:

FASTINT: Yes
RSVE: NO
HISP: NO
REPL: (this one we had probs with, how do you input it to redirect say 19200 to 57600? we tried 19200 / 57600, 19200/57600, and the reverse, but when rerunning MFP via SETTER.TTP it only shows the second number)

DTR:On
RBL:1024
TBL:1024

any help is appreciated!

5085. PLAYMPEG v0.68

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-03 02:12:13 UTC
From: mdg@ukc.ac.uk
Message-ID: <10555@gos.ukc.ac.uk>
Source record: 30167
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Announcing the release of 'PLAYMPEG v0.68' - *THE* Falcon MPEG player.

PLAYMPEG v0.68 should be available on most popular FTP sites within the next
few days - the version uploaded is greyscale only, to obtain a colour version
you can register by sending 5 pounds (10 pounds for non-UK residents to
cover postage and bank charges) to the below address:

Martin Griffiths,
7 Long Acre Close,
Canterbury,
Kent,
CT2 7TE.

Features added v0.60 -> v0.68.

- Plays all MPEG files (P/B Frames are skipped but all I frames are displayed)
- Restores the screen resolution correctly when using Screenblaster(at last!)
- Handles large MPEG files (upto 480x384) - this limit is imposed by the Falcon
hardware, since True Colour cannot have a horizontal resolution of more than
480 on a standard SVGA Monitor).
- Error tolerance is again(!) much improved, with no loss in speed,
(i.e. 17.62 FPS for MJACKSON.MPG))
- Works on ALL accelerated Falcons, including 50mhz DSP, 40mhz CPU!).
- No annoying DSP '.LOD file 'anymore :-).
- Additional program 'INFOMPEG' provides detailed information on MPEGs.

I urge all users to register this program, 5 pounds is not much to ask for a
program which is heading towards a full DSP based implmentation of the MPEG
standard.

Cheers
Griff

I believe you misunderstood (perhaps the author was refering to his RSVE
hardware mod, which can attain such speeds on Modem1). Modem1 cannot
reliably go faster than 19200 without hardware modification.

No ring indicator on Modem2? Does that mean it is missing a line or
something? There are docs on how to fix problems with both Modem2 and
Serial2 (a GAL programmer is needed). Email me if you are interested.

5087. Just got HD, How connect

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-03 05:26:03 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <10031994.052603@empyr.dircon.co.uk>
Source record: 30176

Hi Everyone, especially those who pointed me in the right direction about what to buy / leave at the auction I've just come back from !

I have bought....a Rodime RO3128T Type 04 SCSI HD, 120Mb
and... a Lion 320VC External SCSI subsystem.

I paid 25 UK Pounds (about 38 US$) for the drive and 12 UK Pounds (18 US$) for the box with the connectors, PSU & fan.

Right, here comes the inevitable....<g>...

The drive spins OK, I can't test it yet as I don't have a host adaptor.

Anyone know how to plug them all together ?

The SCSI box has room for 2 HDs (it has 2 SCSI connectors, power plugs etc) It has 2 numeric displays (mechanical) on the back, with little + and - buttons on each one. By pressing either the + or - buttons, the number cycles from 0 to 9 (or reverse, if you press the - button !). These appear to be multi-way switches. From the back of each switch comes 4 wires, colored Red, Blue, Yellow, Black. These are grouped into three pairs with Black common to all. Nothing else is connected to the switches. Each pair of wires is terminated with a tiny 2 pin connector. These look as if they could fit onto the group of 6 pins on the back of the drive, like this..

...where the number 1's (or 2's, 3's) mean the wires in pair 1, 2 or 3.

The SCSI connector looks simple enough - which way does it go in ? It would appear to fit 'upside down' too.

The drive itself appears to have no dip switches or anything like that, apart from two small pins that you could link, and these are near a chip marked ICX 06358
8844
USA

This is a square, 28 pin device and one of the pins referred to above is connected to pin 7. (Counting anti-clockwise from the little 'dot' [top left corner] on the chip). (I'm only mentioning this as I've heard you need to switch parity off, and I'm hoping this is where you would do it)

That's it really.

In case it helps, the following info is also on the drive:

Assembled in Scotland
30144068 Build Level 007 Option K
LR50240
8926 127
0688-1-03 0140-5-15 0260-5-16

What I would like some kind soul to tell me is....HOW do I plug it all together and what do I do next to get it working with my STFM ?

I understand I will need a host adapter, ICD Link or something like that, and some software for running the HD. Where can I get these things ? (preferably in the UK, but I'll buy from anywhere !).

Could I ask you to reply via e-mail please ? As my sysop is just about to drop the atari echos from his system. My address is:

Kevan@empyr.dircon.co.uk

Thanks a lot friends.

Cheers.
Kev

P.S. The auction was worth a visit, but it was quite funny watching some people bidding up to 90% of the full retail value of the gear, and there was only 24 hours guarantee ! One guy even started bidding against himself ! <g> Prices were, well, disappointing. They had stuff like 486sx25, 1Mb RAM, 170Mb HD, 1.44 Floppy, 256k VGA card, keyboard, all brand new, these went for 320 UK pounds (500 US$), BUT they had NO monitor, mouse, software, support or guarantee. Various cards went for about 10 UK (15 US$), 14 inch SVGA 1024 x 768 - 130 UK (200 US$) There were 286 systems, used (very !), 5.25 inch drives, 640k etc, these went for between 30 UK and 70 UK (45 & 110 US$). It seemed a good place to go if you were building your own PC system, as motherboards & drives etc were quite cheap. The ONLY bit of Atari kit they had were 3 internal floppies, used, not sure if they were SS or DS, but they went for 8 UK (12 US$) each.

Is this button the default? It should be because otherwise users who don't
know about this incompatible format always get the wrong (i. e. not
compatible) format if they are simple using the ICD defaults.

>This other stuff you are on about is not available world wide, and if its that
Some of this is available world wide. HDDRIVER e. g. is distributed in an
English version by System Solutions, GB.

Ahh yes, but Lattice 5.5.2 doesn't work properly under TOS 4.02 - the nested menus cann't be accessed properly, so you cann't configure the compiler easily (you can set it up by hand in a project file though).

>--
I guess that clears things up a little. I was aware of the process
of cutting mfg costs, but normally, companies will go with a less
expensive buffer/driver, DRAM's, PAL's, or maybe even hard disk,
floppy disks, whatever. I guess I was under the impression that
CPU's were exempt from cost cutting rituals.

At any rate, I hope to do an 030 upgrade on this machine and at that
time, the brand of 68K shouldn't matter since it won't be used anyway!

Now, does Gadgets by Small still make an 030 upgrade card for the
Mega STe?

5095. Problem: Apple 300 CD-ROM and Egon! CD Utilities

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-03 15:56:25 UTC
From: Ton van Overbeek <TVOVERBE@ESTEC.BITNET>
Message-ID: <94276.155625TVOVERBE@ESTEC.BITNET>
Source record: 30184
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently bought an Apple CD-ROM to be connected to my TT. As software I bought the Egon! Cd Utilities, Version 1.50. Of course, the combination does not work (otherwise I was not posting this message)

The TT is talking to the CD-ROM via the SCSI bus. The CD-ROM identifies itself as 'SONY CD-ROM CDU-8003A' when sending the SCSI inquire command. I checked this with both AHDI (CD-ROM as SCSI target 1) and with the SCSI example program from the German Profibuch.

Has anybody gotten this Apple CD-ROM to work, and if so with what software ?

Please reply also by email, since our newsfeed has been flakey the last few weeks.

Ton van Overbeek, tvoverbe@wk.estec.esa.nl

5096. Problems, ideas, announcements wanted!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-03 16:01:29 UTC

Message-ID: <36p9sp$roq@mserv1.dl.ac.uk>
Source record: 30177

Hi,

I have created my own Atari Page on the Web and would as part of this service to the Atari community like to invite you all to send your ideas for things to include. I would also appreciate any problems you would like solving (not personal) as I will do my best to find the answers for you. Have you any Atari related announcements to make? Then this could be the place to put them, although less than two weeks old this page has already been accessed by over 600 people and this is bound to increase soon with a mention in Future publishings new magazine ".net:The Internet Magazine" and I believe the next issue of ST Format.

Have you written any articles yourself that you would like to submit, or would you be available to answer peoples questions? Let me know if you think you can help me in providing this service to the Atari public. This is not a commercial enterprise but is done in my freetime and there will be no money involved.

If you have written any softwares reviews for submission, have an area of expertise or just want the new piece of software you've written to reach the public quickly then let me know. I promise to try and answer all letters and to evaluate all submissions for inclusion. Hope to hear from you all soon.

Thanks,

Mark msh@dl.ac.uk

5097. Problem: ST hard drive dying.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-03 16:40:57 UTC
From: cf580@city.ac.uk
Message-ID: <1994Oct3.164057.20756@city.ac.uk>
Source record: 30178

A nice simple question for you. My hard drive is gradually dying
my degrees; I had to reformat it this morning. All I want to know
is whether it's the drive or the adapter going.

I get regular "Data on drive ... appears corrupt... Cancel / Retry"
messages, and on the second (or third, or fourth) retry the data loads. I
also get regular Sense Error codes (it's an ICD interface) in flavours of
00, 03, 07, 17, and FE. :)

I'd guess this means that my drive is quietly dying; is it just a case of
replacing the drive mechanism, setting a few DIP switches and
reformatting? I can handle that easily enough, I had to do it this
morning when the ST refused to boot off the hard drive (and the various
floppy utils insisted that my drive was attached, but had no bootable
volumes, and refused to access any partition... I love computers... ;))

TIA.

Hi all, especially those who can tell me where to get a SCSI host adapter cheap !

Anyone from 'TOAD' reading this ?

I have seen posts mentioning ICD Link II selling for $90 in the US, The cheapest I can get it here in the UK is $135 !!! Would it be cheaper for me to buy from a company in the US, or would the shipping charges cancel out the price advantage ?

I have never had a HD on my STFM before, so I would be happy with say Link v1, or ANYTHING that would work. (Anyone selling a cheap SCSI host adapter ?)

Just out of curiosity, would it be possible to BUILD such a device ? I am pretty good with electronics [up to a point !] or does it need dedicated firmware in ROM or something ? Just a thought.

Also, WHY do I need a host adapter ? I take it that the original Atari HDs didn't need one ? Let me guess....Atari made their HD port completely non-standard, therefore ensuring sales of Atari HDs ? Why SCSI ? Where can I get a FAQ on this subject ? (pref UK). Why do I keep saying 'why' ? <g>.

Many thanks.

Kev.

5101. Lynx on a Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-03 20:53:33 UTC
From: d2cg@dtek.chalmers.se
Message-ID: <36pr0d$la3@nyheter.chalmers.se>
Source record: 30180

A few days ago I downloaded the port of lynx that is available at twi.tudelft.nl, just to find it crash on my Falcon running MintNet. It crashes directly and the cause seems to be an address error.

Is there someone out there that has managed to make lynx work on a Falcon? All suggestions and hints are welcome...

Christer.

|
|A follow on to my previous post, The Atari Compendium covers TOS 1.0
|through TOS 5.0, MultiTOS, and Falcon030. It has 860 pages. ISBN:
|0-9638331-0-3. The $49.95 is a suggested retail price. may be available
|through your local dealer or the source is :
|Software Development Systems, 996 Redondo Ave. #404,
| Long Beach, CA 90804 (310)430-0364.
|Please note: I have NO connection with this company. I have a friend who
|purchased this book to solve his programming problems and in spite of the
|steep price he said it was well worth it.
|

The Atari Compendium is 860 pages, packed full of more info about TOS
and Atari ST hardware than you can shake a stick at! $49.95 is more than
reasonable for the book. In fact, its about $100 too cheap!

I am looking for an application for the Atari STE which will allow me
to develop schematics for PC boards. Specifically I need a package
which has a library of Intel and LSTTL logic chips in it. I have
GFA draft and JILCAD-2 but they do not have a library of the chips
that I need. I am developing an 8088 micro board for my microprocessor
system design course and need a software package to help me before the
end of the week. I would hate to have to use ORCAD on an IBM!
I know that my Atari is capable, but I need the software.
Please E-mail if you have any ideas.

5104. Keyboard reading in Sozobon C

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-03 23:54:48 UTC
From: lunman@ChamplainCollege.QC.CA
Message-ID: <36q5k8$532@samuel.ChamplainCollege.QC.CA>
Source record: 30183

Hello. I'm using Heat & Serve Sozobon C on my Atari 1040 ST. Can somebody tell me how to read the status of the SHIFT, ALT and CONTROL keys? I've been trying for a while now, but I just can't get it to work. I can't find any functions (or any OBVIOUS functions anyway) in OSBIND.H to do this.

Also, while I'm on the subject, how could I get the position (x,y) of the text cursor. I know there is a way using some negative offset from line a or something, but I haven't found any decent documentation on the subject. I found a LINEA.H header file once with a lot of constants and macros, but it doesn't work under HS C. Anybody got a clue?

Thanks

Jon

I very much doubt it will be $135. Shipping to the UK from the US is not
too bad, it is the other way around that is expensive (or so I hear).

> I have never had a HD on my STFM before, so I would be happy with say

With the original Link, there is no LED that verifies terminator power, and
it does not work with parity enabled devices. The former is just a debugging
aid, the later not a big deal if your drive has a parity jumper.

> Just out of curiosity, would it be possible to BUILD such a device ? I

SCSI is good. The reason you need a host adaptor is that Atari computers
don't speak SCSI, they speak ASCI (which is close). Thus, the need for a
host adaptor board. All ST hard drives have some sort of hardware to
convert from ASCI<->whatever-the-drive-is. Most of the time, that is an
ASCI<->SCSI board, but I think there are some that are ASCI<->MFM (bleech).

Both Diamond Edge (a Norton style package, must-have for hard drive
people) and Cleanup ST (ICD disk fixer only) will fix floppy filesystems
in addition to hard drive partitions. Of the two, Diamond Edge is probably
the better value, as it can do all kinds of neat things with hard drives,
including defrag and back them up. One the other hand, Cleanup ST has
succeeded where DE has failed on me, and is cheaper (about $30 verses
Diamond Edge being ~$50).

There are numerous shareware/PD "fsck" type programs on
atari.archive.umich.edu that you might want to try first. I would suggest
making a low-level copy of the disk first, using something like FcopyIII
(also on atari.archive), and then trying to fix the backup. Hope that helps.

(the HSMODA-package)

MODEM1 you can run at rates higher than 19200Bd only with additional hardware, eg (my) RSVE.

MODEM2 and SERIAL2 you can run without additional hardware at higher rates, and normally MODEM2 / SERIAL2 are at high rates more reliable than MODEM1. But there is a exception: The bug in some MegaSTE which corrupts files transfered over MODEM2/SERIAL2. This bug can be fixed by replacing a PAL with a new GAL.

MODEM2 and SERIAL2 on the MegaSTE have no ring indicator (only on TT and Falcon there is a RI on MODEM2). Some programs detect a ring by the string "RING" send by the modem to the computer, but if the program does not support this, bad!

I do not know how (and where) the RATsoft BBS asks for a ring indicator line? The next version of HSMODA (it will be released in some weeks I think) may solve this problem, depending on whether method the BBS uses for asking the RI.

Greetings, HS

I guess Atari had to take a chance on what standard they should use for their
hd-port on the ST. At that time hard drives weren't as usual as they are today,
and nobody knew what the future standard was going to be. Atari chose ACSI
(yes, it is a standard interface). Unfortunately nobody else did :-(.

By the way: there are at-bus interfaces for the ST now..

Hi,

I have created my own Atari Page on the Web and would as part of this service to the Atari community like to invite you all to send your ideas for things to include. I would also appreciate any problems you would like solving (not personal) as I will do my best to find the answers for you. Have you any Atari related announcements to make? Then this could be the place to put them, although less than two weeks old this page has already been accessed by over 600 people and this is bound to increase soon with a mention in Future publishings new magazine ".net:The Internet Magazine" and I believe the next issue of ST Format.

Have you written any articles yourself that you would like to submit, or would you be available to answer peoples questions? Let me know if you think you can help me in providing this service to the Atari public. This is not a commercial enterprise but is done in my freetime and there will be no money involved.

If you have written any softwares reviews for submission, have an area of expertise or just want the new piece of software you've written to reach the public quickly then let me know. I promise to try and answer all letters and to evaluate all submissions for inclusion. Hope to hear from you all soon.

Thanks,

Mark msh@dl.ac.uk

I would like to use the RAMdisk program RDE v5 to create a bootable RAMdisk on my 14 Meg Falcon. I need someone to step me through the procedure. This is what I have:

1) Run the GEM program RDE.PRG

2) Create RAMdisk as drive M:

3) Load RAMdisk M:

4) Copy all Auto programs and ACC's to RAMdisk M:

5) Back up RAMdisk to file in Auto folder

Here the RDE program states that drive 'M' not installed.
Where did I go wrong?

Sam

From: simonh@perth.DIALix.oz.au
Message-ID: <36rm91$cq3$1@perth.dialix.oz.au>
Source record: 30096

Has anybody out there had any experience fitting a 1.44mb floppy drive to an STE? I cobbled together a board with a couple of Quad Nand gate chips on it with a lot of help from a friend (well, I watched him do it.. I just fitted it into the STE <GRIN>) and I've got a HD drive which works fairly well, but (a) I don't seem to be getting a 5v down pin 2, the HD detect wire, and (b) someone mentioned you should have the Atari Ajax chip to use HD.

I can format, read and write 1.44mb disks under TOS 1.6 (not from the desktop) but I have a switch hanging out the back of the machine which I have to set when I want to use HD, because the HD detect doesn't seem to be working.

I enjoy chopping my STE around, and I would appreciate it if someone can help me on this one.

Simon Haynes

Well, yes the port is non-standard, but it's not for the reason you
stated. Full SCSI compatibility would have quite expensive back in
'84, so they went with a subset, which was cheaper to implement. The
early Macs (Plus, SE) also went this route.

Why SCSI? It's very flexible. You can hang about any device off of it.
And it's fast.

That is right, but only few know that there is a very cheap and simple possibility to do so. You only need a CD4040 chip, cut one pin of the MFP and make some cables between them. Then you have 110 to 19200 and alternatively 38400bps, choosable with a simple switch.

regards,
Volker

>but (a) I don't seem to be getting a 5v down pin 2, the HD detect wire, and
>(b) someone mentioned you should have the Atari Ajax chip to use HD.

I'm sure someone will correct me if I'm wrong, but some older HD floppy
drives don't implement a High Density detect signal. You may have one of
those drives.

>I can format, read and write 1.44mb disks under TOS 1.6 (not from the desktop)

Lucky you! A while ago I bought an HD "kit" from System Solutions for my
ST. I'm still having problems getting it to work reliably, despite recently
installing an AJAX chip. The "driver" program which came with the kit that
supposedly changes the controller step-rate when in HD mode, is pretty
well useless as it's very picky about what order it goes in the AUTO
folder, and seems to make the system more crash-prone. I'm not even
convinced it works under MiNT...

Anyone else had similar problems with the "Elco" HD kit? (I think that's
the name of it)

5124. Sounds in HighSpeed Pascal?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-04 18:05:50 UTC
From: garnerg@esu.edu
Message-ID: <36s5hu$ln6@jake.esu.edu>
Source record: 30101

Can anybody tell me how to make sounds in HighSpeed Pascal? I can't figure out how to make the darn thing even beep! I know of the command DoSound but I can't figure out how to use it correctly. Any information on how to use this will be appreciated (tell me how to bring in digitized sounds and I'll kiss you!)

Thank you.

5126. Mem Upgrade advice please

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-04 18:40:14 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <10041994.184014@empyr.dircon.co.uk>
Source record: 30100

Hi Everyone,

I've just got a HD for my STFM, and would now like to upgrade the memory.
Why, I'm not too sure ! It just seems like a good idea ! I don't have any out of mem messages or anything. That's a point, can anyone give me a good reason to upgrade my 1Mb machine ? What benefits would I get from say, 2.5Mb ?

Anyway, what I want is to do a D.I.Y. upgrade, to keep the cost down.
I know I can do one with SIPPS (8 or 9 chip 1Mb only), BUT, can I do it with any other chips ? Because I'm having trouble finding used SIPPS.

Can I use SIMMS ? Are SIMMS and SIPPS fundamentally different devices, or do they just have different connectors ? (because Gasteiner do a SIMM-SIPP adaptor for $5)

Must I use ONLY SIMMS/SIPPS with 8 or 9 chips on them, or could I use the three chip ones (which are plentiful on the used market), and must they be only 1Mb ones ?

Thanks in advance.

Cheers.
Kev.

>Your example does nothing - it writes back the same bytes in the same
>order as they were before.

Whoops! Your absolutely right. I'm not sure how I screwed that one up,
but I created the idea awhile ago and never wrote it down. It was originally
configured more like a stack, so I think it should be.

move.b (a1)+,-(a6)
move.b (a1)+,-(a6)
move.w (a6)+,-(a1)

Assuming that a6 points AFTER a word of storage in this case. Sorry about
that.

The above should work - I check it on paper. And of course the final
value could be put in a reg for more speed, especially if you don't
want to write back the result (as in my case), so replace -(a1) with
d0 or d1.

I used a6 instead of a7 since a7 will always be word aligned, but a6 can
have screwy alignment (it actually wind up with the same alignment after
the code runs anyway).

>(BTW - your attribution is wrong. I didn't write the fragment with the

> With Atari compatible partition schemes you can use any hard disk driver I
> know without reformatting or repartitioning your drive.

Is there any reason why the other HD drivers don't support the ICD
partition scheme? As far as I know, the layout of ICD root sectors is
known (documented or reverse engeneered, I don't know; this info
should be legal to use either way), and it would increase the market
for those other drivers, too.

I really had big difficulties in switching to another driver when I
wanted to, because I had Minixfs partitions for which I didn't know
how to modify them to allow for the additional AHDI "helper" root
sector.

> A nice simple question for you. My hard drive is gradually dying my
> degrees; I had to reformat it this morning. All I want to know is
> whether it's the drive or the adapter going.

Its probably the drive. Host adaptors tend not to wear out as they have
no moving parts - unlike the drive ;-)

OTOH if you have recently moved the drive, it may be a lose chip or cable
on the host adaptor.

The bottom has dropped out of the hard drive market in the last couple of
months, so maybe now its time to upgrade to a bigger drive. I've seen 1.0G
drives going at under 500ukp +VAT (can't remember where though ;-) Should
be able to pick up something smaller for *much* less!

:-)

Roland.

>on the transputer software side and on Morheus, the SCSI ASIC.
>BTW What is the estimated performance of ATW SCSI ?

If you need help, I may be able to get you in touch with someone on GEnie;
I think there are a few people who would know the tech stuff. As for the
speed, a fully outfitted ATW (all transputer boards installed) should run
something like 1/5th the speed of a Cray Y-MP. Pretty fast!

BTW, there has been some discussion lately on GEnie that there are still
some of the ATWs left in the Atari warehouse (esp. in England?). If
anyone's interested in buying some, contact me via email, and I'll put you
in touch with the right people on GEnie to try and find you one.

Regards,
Tom

5133. TeddyTerm 2.1

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-05 02:02:03 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <36t1er$e2n@golem.wcc.govt.nz>
Source record: 30111
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well as a few people here raved about TeddyTerm 2.1, and being
a avid Flash 1.6 user i thought I would give it a look...

Well has far better support for Zmodem and let you have Auto Zmode...

Had a bit more glitter than Flash 1.6, but as they say all that glitters
is not gold...

Has a lot of features that Flash 1.6 does not have, but I could not find
any use for all these features, they were no usefull..

One BIG BIG minus is that it does not support a capture buffer, its a external
thing, and no Editor, how a Flash 1.6 user here could rate this program
as better than Flash 1.6, I would like to know, the capture feature and editor
are one of Flashes 1.6 big points, I have read that its the envy of PC Clone
users....

I am still trying to find a Replacement to FLASH 1.6 that is as fast, uses
standard fonts, I think I have tried them all, THE STORM was my hope but is
still very buggy....

Here is a list of Terminal Programs that I have tried..

MasterLink,Interlink,St-Talk Pro,Connect,Rufus,FDT,Teddyterm,Taz,Trapido,
Flash 2.2,STalker3/STeno,ANSITerm and Uniterm, plus a few otheres that I
can't think of now and a few demo ones...

Trapido looked a possibility but its no longer supported, some are far to slow
and only work best on a TT/Falcon, but those machines are far to dear here,
at least 3 times a good 486 Pc Clone and NO SUPPORT AT ALL...

So when are we going to get a Good Terminal program that works on
a ST/STE/MEGA, that is at least as good or better than Flash 1.6...??

> also get regular Sense Error codes (it's an ICD interface) in flavours of
> 00, 03, 07, 17, and FE. :)

Dunno if you should actually pay much attention to these. I've got a
Seagate ST-296N (85M SCSI) that has been giving me endless Sense $17
errors ever since I moved it off of SCSI ID 0; when it was at ID 3, it
gave me lots of write errors, CRC errors, and Sense $17 (read) errors).
I moved it to ID 4, and now I just get occaisional Sense $17 and "Data
on drive <foo> may be damaged" "Retry | Cancel" alerts... usually when
I'm trying to degrag the damn thing.

Apparently, the ST-296N that I have just doesn't like to be any SCSI ID
other than 0. Yes, my system is properly terminated, there are no ID
conflicts or anything nasty like that.

Because of my experiences, I'll never buy another Seagate hard drive,
even one of the high-end ones (unless I can be assured that WREN made
'em, instead of Seacrate).

Dunno if this helps you at all; might give you a bit of a clue if your
disk used to work fine at another SCSI ID...

Jason-
I have a system which is essentially a 1040STf (a 520STfm upgraded to 1024K and the drive upgraded to double density). It has TOS 1.0 and I use a Hayes Accura 144 with no problem. As for a comms program that will emulate VT100, ANSI, etc. just try to get one that does NOT use GEM. GEM is too slow to "draw" the text in its windows and keep up with 14.4kbps. I use TAZ, which offers vt52 and ANSI emulation and is shareware and available from umich Merit Atari archives. TAZ is good because it is written entirely in machine language and does not use GEM, so it is fast. It is full featured, too. Unfortunately, it doesn't have built in zmodem or kermit, but you can use external protocol drivers if you want. Anyway, my friend has a Packard Bell 486dx 66mhz with a built in 2400 bps modem. He laughed when he saw that I use an Atari. But now he uses my computer to download files at 6X the speed and he just sticks the floppy into his computer and copies the files onto his harddrive. Nice to see that a ten year old atari can still be useful.

You have to flip one of the DIP switches in the lower part of the
housing. I just can't remember which. I think there are three of
them; two are meant to change the ACSI address, the other to
enable the second drive.

Gruess mir Erlangen!

As far as I heard, there are two types of Falcon flying around (sorry)
one with SIMM cards, one using some sort of non-standard memory card.

>Simon Haynes

Some WD 1772 02 02 chips should work, but don't forget the step rate,
as this has to be changed, there is a patch program for this, as you double
the clock speed the step rate will go from 3ms to 1.5ms, the drive would not
work, I did read that 1.4 meg drives need 6ms step rate...??...

Pin 2 on a 1.44 meg drive is a OC output, ie, Open Collector , you
will need to add a pull up resistor in your setup PC board, like a 2.2k
for TTL or say 10k for Cmos logic, one end of this resistor goes to +5 Volts...

This should help you with your problems...

> (Quantum) drives? :-)

I think that there is a bit confusion about SCSI-id and LUN:

The SCSI standard allows for 8 devices connected to the SCSI bus. Each of these devices is identified with a SCSI-id (0-7).
Furthermore it is possible that each device consist of 8 so-called logical units. Such a unit is identified with LUN (also 0-7).

Normal practice is that each device only has ONE logical unit (the HD or CD-ROM). However, I once connected a SCSI device with 2 logical units (a 40 MB HD combined with a 60 MB tapestreamer) to the SCSI bus. In order to reach each of the devices you had to specify the same SCSI-id AND a different LUN (this was on a MAC, but even there special drivers where supplied)

Now most software does not support more than one logical unit per SCSI-id due to the fact that you normally only have one logical unit (LUN=0) connected.

Hope this clarifies some.

/Rob

5142. Problem with Bconout(5) under MiNT

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-05 11:20:38 UTC
From: slh100@tower.york.ac.uk
Message-ID: <Pine.SGI.3.90.941005121515.28577B-100000@tower.york.ac.uk>
Source record: 30119

Help! I have a problem under MiNT (0.95) when displaying graphics characters using the BIOS function 3 (Bconout) with a parameter of 5. This is supposed to allow output of any of the 256 characters, and works fine when MiNT is not installed, or when using TOSWIN. The problem comes when I run my code from the desktop or a cli under MiNT. In this situation the Bconout(5) seems to be treated identically to a Bconout(2), processing control sequences rather than displaying them as part of the extended character set. Is this a bug in MiNT, or am I doing something wrong?

My Falcon certainly did not have SIMMs. It had an Atari memory board, which
had surface mount memory chips up to 4MB. (ie eight chips, 4MBx1bit).
According to the silk screen on the board, it's used for 1MB too (presumably
with 1MBx1bit chips). But upgrading yourself would be difficult.

I bought a FalconWING board, which adds SIMM capability; then put
on 4 4MBx8 SIMMs for 14MB total.

The 4M Falcon did not have simms - at least mine didn't - but it was one of the early ones. I don't know about the 1M Falcons but I would expect them to be along the same design as the 4M with a memory board with 1M worth of chips on it. My understanding is that you have to "waste" the 1M since there is not much you can do with it. This, I believe, has kept a lot of people from buying the 1M Falcon and choosing instead to go with the 4M off the bat (plus you get internal HD and software that way.)

BTW - I still have a 4Meg board for the Falcon if anybody needs one. Contact me and we can wheel and deal. Wayne Booth

>Can any one confirm this....??

The Falcon doesnt use normal SIMMs slots, rather a daughterboard that
sits in the machine. On this daughterboard is memory, and could differ
in implimentations.

The 4mb board that comes from atari is useless as is, since its got
memory chips soldered on, and is only useful for another falcon that
might have 0 memory.

Third party boards offer the capability to remove the atari daughterboard,
and replace it with a daughterboard that HAS SIMMs slots, and gives you
the ability to go to 14/16 megs. I got one such from Toad, for $65, and
populated with 4 4mb SIMMs I had laying about.

To move STe SIMMs into a Falcon would require such a board. If one
can purcahse a 0 memory Falcon, this would be a good idea. Youve
already got 4mb of memory from your STe, so that cost is transparent.
You would need one of these memory boards, but even unpopulated memory
boards go for under $100. The in the future, when you run into the
walls of 4mb, you can simply pull the 1mb SIMMs and replace them with
4mb SIMMs and go to the top with 14/16mb.

There are also apperently third party products which will take you
above 16mb, but the cost here grows.

(to answer the above, the ICD host adapter is essentially a transparent
device that performs the fairly simple translation between ACSI and SCSI.
In essence, all modern hostadapters are created equal.)

>> The dumb ICD software only works with their host adapters, but HuSHI
>> and HDDRIVER work fine with their hardware.

ICD's software looks for the realtime clock on ID6 (on those adapters
that have RTCs), and also for some odd quirks (harmless) that they
exhibit in order to identify their own adapters.

>Depends on the number of harddisks connected to the hostadaptor. HDDriver
>supports LUN 0 and LUN 1, but AFAIK at least some of the ICD hostadaptors
>will allow more than two devices. Those who have more than two harddisks
>connected to the same ICD hostadaptor will be stuck with the incompatible
>ICD software.

This is, of course, total rubbish. ICD hostadapters don't perform any
ID<->LUN mapping, all devices on the SCSI side of the hostadapter occupy the
same ID space that devices on the ACSI side do.

If a device on the bus responds to more than one LUN, that's fine.

5149. MiNT & MinixFS

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-05 14:07:15 UTC
From: psherwoo@jpmorgan.com
Message-ID: <36ubuj$360@archive.ny.jpmorgan.com>
Source record: 30137
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here's one for all you MiNT experts:

Having downloaded and compiled MiNT 1.10 (pl8) I find that MinixFS no longer starts up when I boot. I thought that the patches to 1.10 were supposed to make it work but this doesn't seem to be the case. I also tried applying the patches to take MiNT to 1.11 (pl2) but this didn't work either.

One thing that occurred to me was that in my gcc setup I have replaced the include files with the MiNT ones (pl44) and compile MiNT with the '-mint' flag. If I don't do this then MiNT doesn't compile at all.

Any help with this would be greatly appreciated...

My system: Falcon 4/127, TOS 4.02, Gcc 2.5.8, MinixFS 6.10

Thanks in advance,
Piers

Roger, Nope you are incorrect.. the Falcon uses a board that slots onto
two rows of pin connectors. You can buy a third party board that will
accept SIMMs tho. I personally have one of a very few official 14Mb
boards that atari produced :)

: So it would be easy to upgrade a 1 meg Falcon to a 4 meg one,
: just like a STE....

Nope :(

Well Roger, from what I have gathered you are not a FzDt fan, but
I cannot go along with the fact that Flash 1.6 is a better program.
It is soooooo slooooooowwwwww.

I like nice quick screen updates, and after having used Flash 1 & 2
and Stalker, and Connect etc. etc. etc. I really believe that
the registered version of FzDt. kills em all. It may not have VT100
but so what, I use ansi emulation and there is no problem at all.
When you add all the other little bells and whistles in the program
it is ALMOST the perfect program. Perhaps when stuff like mosaic
etc is developed (or am i dreaming) for Atari, then i might change
my mind. Unfortunately Fzdt's problems really are with the authors
total lack of support.

As far as i know ICD micro adaptor can't run if your drive is set to use parity
. I'm not sure how you should be able to disable the parity, but it can be
done.

Source record: 30056

I've been looking at the C-Source1 output from ORCS and working out how to use it. There's no English docs. Why are the pointers to TEDINFO and icon and image blocks referenced indirectly? eg.

The obspec of an editable object holds an index into an array of TEDINFO structures. Why is the index used instead of the address of the TEDINFO itself?

I've written some code to sort it all out, and can now imbed my RSC info in my C, so no problem. I just wondered why it was done this way...

Source record: 30133

Hi All,

Thanks for all your advice about my HD. I've done a bit more research and would appreciate your opinions....

I have contacted several stores in the UK and have been given the following prices for SCSI host adaptors:

Gasteiner GE Soft - 60 UK Pounds / $93 US / 143 DM
Gasteiner Top Link - 70 UK Pounds / $108 US / 168 DM
ICD Link 2 - 90 UK Pounds / $139 US / 215 DM

What are the relative good & bad points of each ?

A friend recommended the AdSCSI + to me, but I have been told that these are no longer being produced.

These appear to be the only host adaptors available in the UK. Could I have opinions from you on which you think I should go for please. I don't really have a lot of cash to spend, so if anyone knows of a cheaper alternative, I'd be very glad to hear from you !

Thanks.

To use simms you need an additional board, because the Falcon has an own memory board. With the simm board you can use 256k, 1M or 4M simms. You must have four of a kind => 1M, 4M and 16M(14M) is possible.

I hope I got this correct...

Yup, it probably did.
But something else to note is that eg. CD-ROM shifters uses LUNs to access the different CDroms. As far as I know, only two CD-rom drivers support this. And neither of these are generally available (yet). One is a driver from Brian Grier (bjgrier@bnr.ca), and the other one is written by me. Mine will be made available as shareware as soon as mint 1.11 goes official. I don't know what Brian will do/has done with his driver though...

Hi Dwight, Well I will suggest that Knife ST may be of help. It is
avaiable from Atari in a pack called "An Introduction to Programming
Utilities" the pack includes:-

WERCS
FONT KIT PLU 2
KNIFE ST
SAVED!
ATARI ARCHIVE
STREE
DESKTOP CALCULATOR
and DESKTOP CLOCK.

This pack may not be avaiable in the US as it has on the box Atari UK's
address but at least you should be able to get Knife ST there

There are many other programs that can handle your problem but I have
found Knife the most reliable.

hope this was of some help.

Hello!

I would seriously like to register your program, but sending you 5 pounds
would probably cost me quite a bit more than the equivalent in dollars.

I wrote ANSITerm. The registered version is $15. How about a trade?
Considering that you have a Falcon, I don't know how useful that would be
to you, but if you can think of anything else, I'm willing to talk.

Thanks.

P.S. I have version 0.6, and I was able to play two of the 8 MPEG's I have.

Anthony Watson's Mountain Reader II (formerly Mountain QWK) was released this summer. There's a demo at umich and other sites. It reads QWK and BW packets. A great program--many features and niceties. Well worth the price if you do much offline reading.

Hi All,

I own a 4meg STFM with Hard Drive. It does all I want it to - except
I would like a bigger screen....

There are options out there such as Overscan and things like that
but all have their merits and downers.

Has anyone got such a system up and running sucessfully with Mag!X
installed?
How easy was it to fit, how much does it cost and where from?

Any help would be appreciated.

Thanks,

Beric Dunn (bericd@hpcpbla.bri.hp.com)

5172. HD or CD-ROM ??? Help!

Source record: 30046

Ok I have about 400 pounds to spend on my Atari Falcon030.
I have a 4meg machine with an 85meg internal IDE. I am constantly
running out of HD space, but things are not _that_ bad, ie I can manage
with what I have, just.

I have always wanted to get a CD-ROM drive for my Falcon, so please what
would you recommend? For 400 quid I can either get a 170meg external HD
and have some decent change left over for an FPU perhaps, or I could go
and buy a CD-ROM and a few CD's.

I am very interesting in computer graphics and animation, hence the new
selection of PC GIF disks and 'Hot Sound & Vision' Cd's interest me greatly.

But please I can't decide.... advice VERY much wanted!

Hi!

>Just a quick question...
>Can anyone post the relative merits of Minix ST vs. Linux 68K?

Minix is an older trial to implement Unix on a ST machine. It's no longer supported, only runs on ST-machines (no TT, no STE), is smaller an faster than Linux but is missing a lot of features you expect of a true Unix system (no XWindows etc.pp.)

Linux is only available on TT machines (because it needs the PMMU), in the actual version it takes about 20 MB space on your harddisk and it will grow much more 'til the development is finished. You need about 8 MB RAM to get it work properly. But what you get is Linux :-) and they're trying to make it binary compatible (is that right? Sounds so funny...) to all other 68xxx machines which means, binarys compiled on an Amiga 4000 will run on a TT as well... (at least they hope so..)

Try Kbshift(), which is slow(ish), or alternatively there is a pointer
in the OS header to a word containing the shift-key state. Look for
documentation on the OS header for more details.

From: tom_smith@ccmgw.bal.mmc.com
Message-ID: <370sic$ima@theopolis.orl.mmc.com>
Source record: 30065
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have a 1040ST (1986 vintage) that no longer works. The power light doesn't come on. I don't know a
lot about hardware, but I did pull out the Power Supply board and found that its getting 125 volts, the
switch is OK, and so is the fuse. So much for the things I can fix. I then checked the 6 wires coming off
the board: 2 red 5 Volts, 1 blue 12 Volt, and 3 black (I guess these are the grounds?). I found that there
is no voltage across any of these, e.g., red to black, blue to black. I think this is a bad sign!

Can anyone tell me if I tested this correctly?

Can anyone tell me where I can find a Power Supply?

The Power Supply board is labeled: 5657-B001-1.
The Mother Board is labeled: C070523-001 1986 Rev C

I'll take any help that I can get.

Thanks.

: only 1Mb ones ?

-- Stuff deleted --

Yes you can use SIMMS - There is a hardware upgrade that uses them, at the mo I can't recall it's name, but I have one and it works well. (help!).

It uses SIMMS of either 256k or 1M in pairs and requires no software patch so it is completely transparent.

The only problems with it is the actual installation (a challange?) and the fact that when I recently bought some new SIMMS to give me 4MBs I discovered that if they're over 1cm in height my ST's case wouldn't fit back on!

The answer was to cut some shielding.. (I wouldn't mind to see a review of the Desktopper, which ST Format promised in September, but didn't deliver).

The new SIMMS I bought were 8 chip and the SIMMS I had previously were 3 chip (Salvalged from an STE) so I suppose the answer to the second question is here somewhere... (were'd I put it? *grin*)

Hope this helps a bit.

Rob.

Oh no ! He's going to get flames from users of *all* these now as well ! <g>

Seriously, I think you must have an old version of TeddyTerm. The only problem I have with it is its transfer protocols, but that's not Teddyterm's fault. I can't get on with XYZ.TTP and don't know of any other external protcol drivers. Apart from that, Teddyterm is fine, it takes a while to load from a floppy, but it is very good nonetheless.

> were exempt from cost cutting rituals.

Nothing sacred about the CPU ;-) Its just that Intel would like you to
believe it matters who made it!

> Now, does Gadgets by Small still make an 030 upgrade card for the Mega
> STe?

In Europe the PAK3 board is all the rage. Fits a MSTE (though you will
either need to externally mount the PSU, or recase the MSTE), and is very
fast. A 33Mhz board (PAK3/33) gives a Dhrystone rating about the same as
the TT! 33Mhz 68030s should run at up to 40Mhz in a PAK3 board so it should
run even faster. Where the TT beats it is TT-FastRAM. A TT with FastRAM
has the edge on the PAK3 (for any given clock speed), but a fast RAM board
for the PAK3 is apparently being made.

The main problem with the PAK3 is cost. Fitting one to a MSTE is cheaper
than buying a TT, but not as cheap as you might like. The main added cost
is recasing the MSTE as the PAK3 board is too big.

:-)

Roland.

To be somewhat more correct, Minix does run on a TT (using the pmmu) and on
the STE. And sinds there is no Linux for the ST (never will be), I guess
you mean it is faster on the PC (which I dare to doubt). It is true that
Linux has much more features than Minix, but Minix386vm *HAS* (at least) an
X server, and you can probably also run X clients (can't see the problem
with that). And Minix ST is still supported, check out comp.os.minix, altough
the traffic is not as high as in the good old days...

Why is it so strange normal programs are binary compatible over the whole
range, they are supposed to use the same 680x0 code (and no direct hardware
programming, this Unix you know). Although I guess something like an Xserver
can't be portable, but then on the PC you have different code for all the
video/disk/etc cards....

For more info, read this:
http://www-users.informatik.rwth-aachen.de/~hn/linux68k.html

Gerco.

PS: There is also Linux for the Falcon, although it is somewhat complicated
with different groups developing things for te Falcon/TT without notice
of each other.
PPS:Isn't this in the FAQ, it should be (this discussion is here for at least
the thirt time!).

5189. NVDI 3.0 and ET4000

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-06 23:41:22 UTC
From: gert@ttgk.textlitho.nl
Message-ID: <Up-EJHADFUQ@ttgk.textlitho.nl>
Source record: 30072

Hi you all,

Has anyone installed NVDI 3.0 yet ?
I was wondering just how far the compatibility for TSENG ET4000 boards goes, what I mean is can you adjust/set parameters like video ram addresses and IO port addresses ? I'm planning to buy NVDI 3.0 but only if I'm assured that the thing will go with my home made VGA screen output system which is based on a ET4000 VGA card, currently I'm using the VDI driver from the STGA project but my VGA card seems to be a little slow (or my TT much too fast) and I had to delay the timing by some 32 wait cycles on reads and about 16 cycles on write. Now I was hoping that NVDI would speed things up a bit.
Anyone ?

Gert

I need a routine for the falcon to convert a 320x240 TrueColor picture to an 8-bit plane 256 color 320x240 picture.

Anyone out there have a routine for this. I know how to convert the palette values, however I guess somehow the picture has to be downgraded to 256 unique colors too.

Thanks

Paul Blagay

5191. Re: Minix vs Linux

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-07 02:50:22 UTC
From: saj@chinet.chinet.com
Message-ID: <CxA7vz.G0F@chinet.chinet.com>
Source record: 30084

One big difference between MINIX and Linux is that anybody can get MINIX to run, but most of us, even with roughly appropriate hardware, can't get Linux to run.

I just tried to load the latest 680x0 vmlinux (what is it, 0.9pl3? Dated the end of Sept, anyway) with the 0.2 bootstrap (dated Oct 5) on my Falcon030 with 14 MB RAM, an 85 MB Seagate internal IDE drive and a 330 MB Quantum external SCSI drive. It really seems to be getting somewhere, but the screen winds up in a completely unreadable mode (I tried a SVGA monitor, and a Multisync with the switchbox set for either color or mono--they all look like blobs of light scattered around the screen).

I have the bootstrap named as newboot.ttp; I double-click on it and give no arguments to the startup dialog box. vmlinux is in the same folder.

Anyone care to straighten me out?

Steve

5192. alternative st case

Newsgroup: comp.sys.atari.st.tech

From: yc1663@albnyvms.bitnet
Message-ID: <372h78$sib@rebecca.albany.edu>
Source record: 30077

I tried asking in comp.sys.atari.st with no luck, so I'll try here:

1) Does anyone know of the Lighthouse Tower kit? Desk Topper? What
is your opinion of them?

2) Are there any other kits for transporting a 520stfm to a separate
keyboard and box-under-monitor/tower option?

3) Has anyone done it themselves? (I'm sure they have) Is there anyway
to get plans?

4) I have seen many devices advertised that will allow one to use
an IBM detached keyboard with the ST, but I was wondering
if they will support the keyboards with a built in trackball (will
the trackball work on the ST).

This is my problem: I replaced the original SD drive with
a DD drive some time agao. So I am not squeamish about opening the case,
or sawing it(the button on the DD drive required a new hole), or
unplugging and plugging in wires...

But my soldering experience is limited to a few wires here and
there. So figuring out how dto extend the keyboard connection is a problem.
And I'm not sure that the inside will fit inot into a generic
tower case. For that matter, will the ST innards fit inside a mega ste case?

I have only found out about this group yesterday, so I
apologize if this has already been discussed berfore. Yesterday I also read
about a guy sawing the end off his ST motherboard to get it to
fit in a tower case (andthen he soldered wires between the broken connections)
, but that is out of my league.

Any help, or pointers are appreciated. If the FAQ or archives
have information, please tell me where (no RTM's or RTFAQ's please...
altho from reading this group I don't htink it will be a problem.).

Thanks in advance....

Hi,

I would like to upgrade my TT RAM from 4 MB to 16 MB by replacing the 4 Original 1MB SIMMs with 4 new 4MB SIMMs.

What I am not sure is that will my TT RAM board (early version with 3 jumpers) work with 4MB SIMM card and is there a jumper/dip switch on the motherboard that I need to set after upgrading?

Also where can I buy a nybble mode 4 MB SIMM card.

Any info would be much appreciated.

I believe the RAMs on your extension card are too slow. I do not know why, but it is a experience, that 16MBytes must consist of 70ns RAMs from some special vendors (Hitachi works if I remember correctly) or 60ns RAMs (all 60ns RAMs work). If you place in the same board 1MByte SIMMs (=4MByte), 80ns (1MByte!) will work too.

Greetings, HS

I've made my own overscan and it works perfectly well. There are several files around describing how to do it. I also added a 74HC157 to "autoswitch" with the help of a free pin on an ACIA and a small autofolder prog. The same principle as for HD floppy switching. I currently have 752*480 on my SM144.

This depends. If you've partitioned your hard disk AHDI compatible
with a newer version of the ICD software (>= 6.2.x I *think*), you
probably don't have to repartition it. If you did not partition AHDI
compatible *and* have more than four partitions, you *must*
repartition your hard disk if you want to use AHDI, HDDRIVER or HuSHI.

> That could be a problem... 250M backup and restore is very painful
> without a tape drive. Still, it might be worth it!

The AHDI 3.0 standard is from 1989. I think five years after that,
it's mandatory to upgrade to this standard.

> button for this...

You did not get the point. Chris Herborth has the ICD software with the
ICD hardware, so I assume he was not that stupid to buy the ICD Pro
software. ;)

Anyway, there is really no need to buy the ICD Pro software in my
opinion. It's neither fully AHDI compatible nor does it offer XHDI.
It's neither cheap nor does it offer more features than SCSI-Tool
(HuSHI) or Diskus (HDDRIVER). BTW: The standalone version of HDDRIVER
(which is just not able to format disks, which is not needed for newer
drives anyway) is available for DM 30 (about US$ 20).

And the upgrade policy of the non-pro utilities (which is the only
advantage over the other hard disc driver available) is not given for
the Pro software.

> This other stuff you are on about is not available world wide, and if its that
> good why havent I read about it...?...

Huh? All you never heard about cannot be that good?

I think Gadgets' by Small's board is only for a Mega ST (but I am sure someone will correct me if that's wrong). I haven't gotten a response from them when I tried registering by SST - there is a used market for the SST if you want to go that route. I've been happy with mine thus far. And the manual is typical Dave and Sandy, welcome to the family.
Good Luck, Wayne

Hey!

I purchased 2nd hand PC-Ditto, and it mentions I could boot from the Atari hard drive if it had been formatted with MS-DOS and made a system disk. My hard drive has 4 partitions, 2 20MB and 2 15MB.The C partition(Boot) is 15 MB. I moved all my Atari boot up stuff to another drive, started up PC-Ditto, formatted and transferred system files to the C drive, moved my Atari stuff back to C drive. I can still boot my Atari from C drive, and PC ditto, BUT I seem to have "lost" my 20MB D drive! That is, my D drive exists, but reports 0 bytes on drive, 0 bytes free, etc. Has anyone encountered something similar?

Source record: 29996

Hi to all
I have this problem: I want to use a routine in assembly form within my program in GFA. Well, I write the routine in DEVPAC 2, assemble it as executable position indepentent program and save it to disk. Then, I take the file (prg) and turn it into DATA statements. The problem lies when I try to run the programm , it crashes with"ILLEGAL INSTRUCTION EXECUTED" (4 bombs).
Anyone has ever did anything similar or knows where I am doing wrong ?
I suspect that the problem lies in the way DEVPAC 2 assembles my routine, since as I know the GFA listing is OK (I have enough experience in GFA coding)
Please, please help me.......

Thanx

My Falcon exhibits the same problem, which is worse in higher
colour/resolution modes. The fix seems to be to go for a different make of
Simms (I was told which makes but can't remember and as I got
my Simms for practically nothing I was determined to suffer it!)

I was also told to go for faster simms i.e. 70ns as opposed to 80ns (the
original 4x1Mb simms were all unbranded 80ns and worked fine!)

: cable for doing this, and would I need any special software, or other
: hardware for doing this.

You will need a Parallel Interface and a standard DB25 male to male
cable. The software you need to transfer files this way is supplied with
the Portfolio. There is also a Serial interface available, with this you
need to get a SMALL terminal program for the portfolio and transfer via
null-modem. I use the parallel version, its easier and the software is
built in to the PF, all you need is the software for the PC. You can also
print out whatever you want from the PF with this interface.

: Is Toad Computers still in business, and would this be something that they
: might carry?

Yes TOAD is very much still in business, and they used to carry
Portfolio stuff.. don't know if they still do or not.

If you need anything else (help wise) just ask, I've got one of these
things myself.

5209. 3.5" drives in Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-08 03:38:39 UTC
From: ralunsfo@uncc.edu
Message-ID: <37547v$l7m@news.uncc.edu>
Source record: 30090

Does anyone know exactly what is involved in replacing the internal drive of a Falcon with (for example) a 420 MB Connor 3.5" IDE drive? I understand that the speaker must be removed to make space (oh how terrible), but what about cables? Does the Connor kit come with everything I would need, and could I do it with little trouble (I've taken my stock drive out once or twice already, so I don't mind taking apart the Falcon...)?

Thanks much, the more detail the better :)

5210. STe Problem...(KeyBoard Timer?)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-08 07:21:01 UTC
From: bjr2@Ra.MsState.Edu
Message-ID: <375h8t$2tr@Tut.MsState.Edu>
Source record: 29992

I'm having problems getting my 1040 STe to run some programs that were
giving me no trouble at all back when I had my regular ST. My system has
TOS 1.62, 4meg RAM, AdSCSI+ Host, and 80meg Segate HD.

The first program I noticed this problem with involves a little extra hardware.
The Super Charger DOS emulator. The Supercharger itself seems to be acting
normal, however, things on the Atari side of the process are a bit odd.
To make a long story short...everything intitalizes as usual...but keystrokes
on the keyboard do nothing! Almost as if the keyboard were turned off.
I perferformed a little experiment to see if the entire machine is locking
up by running Midi Spy as an accessory before booting the SuperCharger. The
Midi file kept right on playing, but the keyboard was locked up, so at least
I know it isn't a total system lock up. I've also tryed every other thing
I could think of in locating other possible problems with the Super Charger.
I checked and changed DMA adresses...cables...powersupplies...different places
in the DMA chain...with cashe...without cashe...even without the hard drive
connected at all. Nothing seems to work at all!

Back to the keyboard timer theory...
I also have a few ST games that refuse to recognise any keyboard, mouse, or
joystick commands. Dragon's Lair is one example in particular. The demo,
or start up cartoons run flawlessly...but I can't get the game to start when
pushing the joystick buttons, the keyboard, or anything else for that matter.

I've heard that some applications that were written for the regular ST and
earlier versions of TOS grab a different set of timers in the keyboard chip
than do those for the STe. Is there a patch or fix for this? If so where
can I find it? Do you think this is my problem at all?

I just find it odd that my old ST using the exact same hard drive and host, ran
these programs with no problems (it had TOS 1.00), and my new STe seems to
run them okay...except they won't take any INPUT.

While I'm at it...do I need any TOS Fixes for 1.62? I don't have any tos
fixes in my auto folder at all at this point. folderxxx.prg is the only
one I've heard should be used...and I don't need it since I'm running NeoDesk.
(Yes...I did try running the problem software without NeoDesk/Geneva...did it
bare bonze even...nothing in the Auto...no ACCs). I've seen several TOS fixes
out there...but they all say they are for TOS 1.4, or 2.5.

Any suggestions or tips here would be greatly appreciated.

Thanks,
Brian

Does anyone know how to send commands to a SCSI CD-ROM ?

I've downloaded the bindings CDBIND01 from ftp.uni-muenster.de,
and tried with my Falcon 030 + Apple CD300 + MetaDOS 2.2, but
I get bombs.

Thanks in advance.

Vincent Lefevre (vlefevre@ens.ens-lyon.fr)

> I tried asking in comp.sys.atari.st with no luck, so I'll try here:
> 2) Are there any other kits for transporting a 520stfm to a separate
> keyboard and box-under-monitor/tower option?

There is one advertised by ATY Computer in the newest ST Informer magazine (I highly recommend this mag as a general resource). It appears to simply provide an extension cable for the keyboard, a case for the keyboard, and a cover for the keyboard "hole" on the CPU case. The problems is: it seems to be for 1040STE and Falcon only (perhaps they share the same keyboard connector).

With that said, making up a small adaptor to fit your 520STFM keyboard connector should not be too much of a problem, and in fact may have already been done by the company. I suggest you call these folks and see if anyone else has done what you are trying to do with one of these kits.

ATY Computer: (510)482-3775
ST Informer: 1-800-800-2563 (503)476-0071

> 4) I have seen many devices advertised that will allow one to use
> an IBM detached keyboard with the ST, but I was wondering
> if they will support the keyboards with a built in trackball (will
> the trackball work on the ST).

Very probably not. The DEKA interface is the one to look for: completely hardware (no software drivers needed, so it works with games and such).

> But my soldering experience is limited to a few wires here and
> there. So figuring out how dto extend the keyboard connection is a problem.

Why not take the connector down to Radio Shack (or other electronics supply house) and see if you can buy some blank ones? Then, just make an extension cord. I seem to remember that my 520STFM connector is a single line of about 7 standard-spaced pins, so you could probably use some of the "break it off at whatever length you want" generic single line connectors.

> And I'm not sure that the inside will fit inot into a generic
> tower case. For that matter, will the ST innards fit inside a mega ste case?

Well, given that it is big enough, and if you are willing to drill some holes, it is pretty likely that you could do this. The problem would be to route the ports near the back so as not to be inconvenient.

ST innards very probably won't fit an MSTE case (I'm eyeballing mine, and it doesn't look likely).

> Yesterday I also read
> about a guy sawing the end off his ST motherboard to get it to
> fit in a tower case (andthen he soldered wires between the broken connections)
> , but that is out of my league.

That one sounded pretty extreme to me! Impressive, though.

: Anyone out there have a routine for this. I know how to convert the
: palette values, however I guess somehow the picture has to be downgraded
: to 256 unique colors too.

I guess the best way would be to create a histogram for the colors. Find out what are the most 256 colors used, and use those for your pallate.

Then take the 16bit color matches and convert them to the color that you assigned it to. Like 1111011110011110 (light gray) could be assigned to color reg #1. Then convert all light grays with that color value to color register one.

The hard part will be the leftover colors that were not in the top 256 colors, you will probably have to compare then to the ones that are and somehow choose the closest one.

Hope that helps.

Vince

5219. GNU G++ problem

I have a problem with the GNU G++ compiler. I can compile C++ files without problems, but when it comes to linking it doesn't work. The strange thing is that I can compile the files from GNU-Shell with exactly the same setup!

I have the g++.olb and try to compile with the option -lg++.olb with no success. C-files can be compiled and linked without problems.

Any suggestions of what might be wrong is appriciated...

Christer.

From: kevan@empyr.dircon.co.uk
Message-ID: <10081994.182257@empyr.dircon.co.uk>
Source record: 30001

Hi, Can anyone tell me which of the desktop replacements are the best ?

I use TOS 1.2 (1.02) at the moment, and I have seen a few ads for TOS ROMS, usually 1.4. I don't want to spend cash on 'expensive' ones like NeoDesk, and other commercial progs, but I'd rather try a shareware or freeware one first.

I can get hold of Teradesk, Harlekin, TOS 2.06 as a program, or I could buy TOS 1.4 roms, or go the whole hog and get the 2.06 switcher kit, but that's a bit too expensive !

What do you think ?

Cheers.
Kev.

In a GEM program these are returned from the evnt_multi() call. In a
text app, they are returned in the upper bytes of Bconin(). The call
Kbshift() can be used to read (poll fashion) or even change the state
of these keys (including insert and clr/home).

The row is at 0x04ac and column is at ... hmm .. I'm not sure. Anyway,
its bad programming practice, really, to not keep track of the position
yourself. Just home the cursor when you start up or send it to a
specific x/y location on the screen using vt52 commands (or curses library
calls) and keep track of cursor movement within the program. I think
curses may do it for you.

>characters out or something ?

I am the author of ESS-Code; there are a number of things that could be
going wrong.

1) The data could be being corrupted in transit.

If so, you have a problem that is not going to be solved by anything I
can tell you.

2) The data is not being assembled correctly after receipt.

To see if this is the case, get the file send to you in ONE piece. If you
can decode it, then it is likely that the file are not being assembled
correctly (a complicated process, sometimes).

3) The sender is not using UUEncode at all.

This could actually be the case; ESS-Code (and most other decoding programs)
use Dumas UUE/UUD. I believe that there is another (slightly different)
version of the protocol floating around out there. If that is the case,
your problems could be arising from that.

You might also check NOAHDI from Hensa ftp site, especially if you are using atari's ahdi. I used it to get ahdi to recognize a different rll (replacement) drive in my megafile 30, but the text with it sounded as if it's really designed to help the controller acknowledge second (not replacement, but additional) drive. It goes in the auto folder with ahdi, not instead of ahdi.

good luck

I believe this mod is outlined in the file /Utilties/Tosfixes/38400.lzh on
atari.archive.umich.edu. Other mods are in there as well.

5232. TOS upgrade help

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-09 15:21:37 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <3791q1$ffj@mailer.fsu.edu>
Source record: 30012
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I want to upgrade a 520STFM from TOS 1.0 to TOS 1.2. Currently, the six chip TOS 1.0 set is installed. The 1.2 set I have is a two chip set. BTW, I am well aware of the pros and cons of the various TOS versions, and I have a good reason for wanting 1.2 precisely, not 1.4, 2.06, etc. :-)

Anyway, I have been told by several folks that my 520STFM motherboard should have some "solder jumpers" that I can set in some way to inform it about the two chip set verses the 6 chip set. My problem is, I cannot find them! I seem to have a relatively common 520STFM motherboard (memory chips under the keyboard area, TOS sockets in upper left corner). I have been told that the jumpers I a looking for are marked "A16/A17 and CE", but I cannot find anything like that on my motherboard.

So, I need to know how to find these solder jumpers, and what I need to do to them so I can use a two chip TOS set. A diagram or description of parts that are near these pads would be ideal, as well as which pads need to be connected for this to happen. I'd be happy to pay mailing fees if someone has a diagram they can Xerox and send me.

I am assuming that these are just empty solder pads, and one "jumpers" them by running a bead of solder between them. Is this assumption incorrect? Maybe that is why I cannot find them :-). Any help would be greatly appreciated.

Please email me directly. I'll post a summary and put instructions on atari.archive.umich.edu. Thanks in advance.

Oh, if anyone has a six chip TOS 1.2 (US version only) set, and would like to sell them, I'd be interested in that as well.

I always use code of the form:

move.l mem,d0
rol.w #8,d0
swap d0
rol.w #8,d0
move.l d0,mem

to convert endians.

In general always try to avoid memory access as much as possible, esp with
020's and above which execute register based operations very quick. Also
try to use 'atomic' instructions like 'rol', 'swap' etc (i.e. without complex
addressing modes), since 040/060s fly through these RISC like instructions!

> Can anyone post the relative merits of Minix ST vs. Linux 68K?

Minix runs on ordinary STs - Linux requires a 68030

Minix will run in 1MB and from floppies - Linux is bound to require more.

Minix is AT&T v7 based - Linux is based on the newer Berkley BSD4.3

Minix is not terriably useful - though *very* educational and good fun.

Linux is much more of a Unix than Minix - and your only hope if you want
to run X-windows on Atari hardware (not that its at that stage yet).

Linux is currently better supported than Minix as there is a thriving PC
Linux wagon - which the Atari wagon is being 'towed' by ;-)

Linux is free - while Minix is owned by Prentice Hill.

Disclamier - I've used Minix and *real* Unixs - but not Linux.

:-)

Roland.

5241. Checking for FPU and CPUs

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-09 21:33:51 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <CxFD8F.A4z@cix.compulink.co.uk>
Source record: 30024

I know there is an FPU cookie which will tell you which FPU is fitted - but is it safe to assume that all machines with FPUs will actually have this COOKIE?

I'm mainly thinking of MSTs with SFP004 cards - and STFMs which have been hacked up with 68881s as though they had SFP004 cards.

Surely these machines will have TOS 1.02 or 1.04 - which don't implement COOKIEs?

Alternatively is there a better method of checking for an FPU?

The same goes for CPUs. Is there a safe check for a 68030 - or can I assume the CPU COOKIE will be set right?

Thanks

Roland.

@CiX

5242. TEXT MODE

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-09 21:33:53 UTC

I mailed this - but it bounced :-(

> I have always wanted to get a CD-ROM drive for my Falcon, so please
> what would you recommend? For 400 quid I can either get a 170meg
> external HD and have some decent change left over for an FPU perhaps,
> or I could go and buy a CD-ROM and a few CD's.

Buy the HD. Apart for playing music - you'd be surprised just how useless a CD-ROM on an Atari is. You soon get bored with looking at clipart (or even Photo-CD disks).

OTOH a large HD is much more useful. Most stuff you might get off a CD can be found on the Net. Also your machine will feel faster - and the internal HD won't grind so much.

On my TT I have a 212MB HD and a CD-ROM. The CD-ROM is hardly used (though occasionally very useful - and anyway is my *only* CD music player ;-), but the HD is so much more useful.

BTW 400ukp for a 170MB drive is not good. You should be able to get 340MB *and* an FPU for that price. If you are willing to build your own - then you should be able to build a 500MB drive for that price.

In fact you might be able to get a HD *and* a CD-ROM for 400ukp. It depends hwo much you know about SCSI drives.

:-)

Roland.

>in GFA coding)

Why don't you put the code in an INLINE statement ?
Be sure to use only PC relative addressing in your code, DEVPAC can be set
to check and ensure you only use these, see the 'Source Checking' button
for this one. I made this mistake also at first, after that, creating
assembler INLINE routines was easy. I use the CALL addr,reg() to start the
routine (be sure to setup reg() with DIM reg(16)) you can easily transfer
parameters to your assembler routine through the reg(0 .. 15), but as you
are an experienced GFA coder, you knew this already ;-)

Happy coding,
Gert

Well, grabbing all the PD/Shareware desktops and giving them a try is pretty trivial, so you should probably do it (easiest way: grab the 0index file from atari.archive.umich.edu and grep "desktop" out of it). I am personally a Neodesk 3 fanatic. I have seen it for sale on the used market several times recently, and of course there is Neo 4/Geneva to think about as well. I'm a bit hesitant to upgrade to Neo 4, as I consider Neo 3 to be a perfect balance between "cool bells and whistles" and "uncluttered ease of use". Perhaps after I see the Neo 4 demo (also on atari.archive)....

As for upgrading TOS, going to 1.4 is probably OK, but I would suggest that you think hard about going to 2.06. I have a MegaSTE with 2.06, and to be honest, I wish I could boot the thing with 1.62. In your case, you would be able to switch between 2.06 and an older TOS, so you would not be restricted by 2.06's inability to boot a whole bunch of games. However, the desktop in 2.06 is nothing compared to Neo 3 (IMHO), and that is perhaps the main attraction of 2.06. It supports HD floppy drives, which may or may not be significant to you (it isn't to me). I would suggest that you put the money needed to get 2.06 and a TOS switcher board toward Neodesk, or NVDI/Warp9, or Universal Item Selector III, or Diamond Edge.....

Note that if you don't have a hard drive, this changes things (as a disk-based desktop is not very fun with floppies).

I personally don't have any problem with TOS 1.2. It can be made almost functionally equivalent to 1.4 with a few auto folder programs (and 1.4 needs a different set of auto folder patches anyway, so you are really just trading one set of patches for another). Some say a 1.4 system is a bit faster than 1.2 even with such patches, but I cannot see a difference (my guess is that NVDI wipes out any slight speed difference between such systems). TOS 1.4 does support the 19" Moniterm monitor card, and 1.2 cannot (strangely enough, this is becoming important to me, so I might have to upgrade to 1.4 despite what I say above :-). I used, and still use

TOS 1.2 heavily, and have never had a problem I could blame on the OS (after I got the auto folder stuff squared away). Some seem to think that TOS 1.2 is some sort of cursed albatross, but my experiences have not indicated this to be true.

The one place where 1.4 is a definite advantage is its extension of the "normal" partition size to 32mb. This is actually a bug in TOS 1.2 (an unsigned integer being treated as a signed one, thus losing a bit and limiting the number of sectors on a partition to be equivalent to 16mb, with normal 512byte sectors). One can use BGM partitions in either 1.2 or 1.4, and get huge partitions, but TOS 1.2 will waste twice as much space as 1.4 when implementing a BGM partition.

In case that was not clear, a BGM partition uses sectors that are larger than 512 bytes, so one can have partitions of up to 256mb on TOS 1.0/1.2, 512mb on 1.4 and higher (this would yield a max of 3.5gb active hard drive storage, 7gb for TOS 1.4 and above, which the ICD docs label "sufficient for most applications :-). The space wasting is due to the fact that the smallest allocatable hunk of the disk is bigger on a BGM partition (the smallest such hunk is a cluster, which is, uh, two sectors I think). For example, let's say that a file you are saving takes up several full sectors, and has one byte left over to store. On a "normal" partition, it will have to allocate 1024 bytes (one cluster) to store that one byte, thus wasting 1023 bytes of space. Now, imagine the same scenario with sectors that are 2048 bytes in length, instead of 512 bytes. You would waste 4095 bytes of disk space for such a file.

So, you will find that on a BGM partition, a set of files will take up more space than on a normal partition (or even another BGM partition with a smaller logical sector size).

Now, TOS 1.2 will, on average, waste twice as much space as TOS 1.4 on a similarly sized BGM partition, because TOS 1.2 has half as many valid sectors to choose from (and must therefore make the logical sector size twice as high to make the same sized BGM partition). A 64mb partition will use a 2048 byte logical sector size with TOS 1.2, and a 1024 byte one with TOS 1.4.

With that said, I am running numerous hard drives on my MegaSTE, but I have them formatted in "TOS 1.2 compatibility mode", so I can switch any device over to my Mega2 and it will work. So, I am wasting more space than I could otherwise be doing, even though I have TOS 2.06 (which is equivalent to 1.4 in terms of this bug fix). Obviously, I don't consider this to be a big deal. Having an instant backup machine is more important to me than trying to save a meg or two of of disk space. We are not talking about a major amount of space here. You could also just live with 16mb partitions, and not waste a byte (at least, no more than you are otherwise forced to).

So, after this incredibly long and boring technical description, my suggestion is still to put your money toward some killer software (some of the "must have" stuff for hard drive owners) rather than 2.06. If you must buy some hardware, you might look as one of the 16mHz accelerator boards. THAT is definitely worth the money (I love the speed of my MegaSTE, the only problem

being that I now have TT fever because of it :-).

Source record: 30034

Hello Happy Atari Users,

I would like to put a 3.5"HD floppy drive in my MegaST4 computer
but unfortunately I do not have all the informations to do this.

What I know:
----
o TOS 2.06 (or 2.05) is the minimum version to have.
o a hardware modification is neededeed : the HD signal from the drive is used
to switch from 8 to 16Mhz for the clock floppy controller chip.
o The controller chip must be a WD1772-02-02 or better an Ajax.
o the steprate in High density mode must be doubled.

What I don't know:
----
o How is the system informed that a HD disk is present n the floppy ?
Is the HD OUT signal used ? If so, is the PSG input port used ?

Everyone who has informations is welcome.
If I have enough informations, I will summarize the answers.

Thanks to everyone.

|>
|>

I posted the above rol/swap/rol example some time ago.
Some "clever" follower taught me that I'd be better of with a bunch of move.b's.
(I guess it was he who renamed this thread)
Griff's explanation and my understanding of >'020s tell that this is not true.

One has to look at the overall performance, i.e. fetching 4 bytes from memory,
turn them around and push them back to memory. Nobody can tell me that
2*4 single byte accesses are faster then 2*1 longword accesses. In fact,
I've used movem.l to fetch multiple longwords. The whole thing was aimed
at '020s, '030s and '040s, not plain 68000's on some 8 MHz Atari.
And it wasn't academic, I had to solve the real problem of in-place byte-swapping Megabytes
of contiguous data for later use with a DEC system.

I saw a review of the desk topper in ST Review (?) and it was very simple. The review shows how to put your Falcon into it but said that it works with the st range aswell. As far as I can remember no or very little soldering was required as the plugs for the keyboard on the motherboard are connected to sockets on the casing by a simple lead.

You could always phone system solutions who do the desk topper they were very helpful when I phoned about their screenblaster s/w.

: Rod

You will have to have MiNT installed. Get the Minix XFS from a suitable site and read the instalation instructions...its very easy. You just put the XFS in a directory (the MultiTOS one I think) and run the formatting s/w to setup the partition...reboot and voila! You can set stuff like cache sizes and filename max lens etc aswell.

> appreciate it!

Plug a 50line flat ribbon SCSI bus on one end, a DB-19 DMA cable to the other, apply power. Both of those are standard cables. They are pretty much plug-and-play devices. You do want to get ahold of the last Supra software that was released, plus some docs for the software, if you can. However, you can also use Atari's AHDI so this is perhaps not required. I would suggest purchasing the ICD Pro level software, which will also work on them (at least, maybe). It is vastly preferable to either of the above solutions, IMHO.

As for pinouts, anything that lists the pinouts for an Atari DMA port and a standard SCSI port should do. I suggest that you not try and make a DMA cable, as they are quite picky about sheilding and such (and cheap to buy). The 50line ribbon cable can be custom-made to your specs by any number of places (I would call some of the drive dealers in Computer Shopper), or you can make it yourself if you have a ribbon cable kit of the correct type.

BTW, I have seen at least two types of Supra host adaptors. One works just like any other host adaptor, in general (plug-and-play). The other type must be physically unplugged from the machine to allow a non-harddrive boot(!). The latter type is very old, but they are out there. So, if you plug one of these things together, and find that you cannot leave the hard drive off and boot from floppy, try unplugging the DMA cable from the back of the machine. Good luck!

5260. RE:BGM Partitions

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-10 13:46:33 UTC
From: gigxr01@nt.com
Message-ID: <gigxr01-101094134633@ngalm099.gal.nt.com>
Source record: 29941

During the recent discussions regarding extended partitions; somebody mentioned that Supra had developed ther own implementation of BGM partitioning.
When I checked with my Supra Adapter manual, there is no mention of this. I believe that I have the latest revision of the software, but I cannot get it to work with BGM partitions (formatted with Atari's AHDI). I assume that the driver cannot understand the BGM.

So, can somebody confirm whether Supra software can/cannot use BGM?

Also, I am considering purchasing new software (HDDriver) as I have heard that it is faster & supports XHDI. I believe that it should work with the Supra adapter. What utilities come with HDDriver, or is it just the driver & you have to get the formatting/editing/utilities somewhere else?

Regards

Hm! What kind of a project is this? Source code? I have recently
been dreaming about building a UNIX-based system for the Powermacs that
through a smart window manager allows GEM programs to be run on the
same desktop with X stuff. The X applications run on PowerPC Linux,
the Atari stuff under 68K emulation. As I (=ZFC, basically) am working
on a library that does almost all of the GEM calls on top of X, I
think that a few good men would be able to make such a system actually
feasible.

Hi,

Does anyone have TOS ROMS they don't want anymore ?

I'm looking for at least TOS 1.4, English Language version.

Replies to: Kevan@empyr.dircon.co.uk
or here in the newsgroup. (But I'd prefer e-mail, rather than clog up the
group with personal stuff).

Thanks.

Hi Everyone,

I would like some recommendations for a good QWK OLR. I have tried
Captain QWK, IMHO, Mountain and MicroTalk QWK. They all have their
own little bugs, and I'm getting fed up with them. I'm using MicroTalk
at the moment, but there is a bug in Hi-res that chops the bottom off the
